IMPIANTO AGRIVOLTAICO “CANALOTTO”

Progetto per la realizzazione di un impianto agrivoltaico denominato “Canalotto” per una potenza complessiva pari a 33,99 MW

Il progetto in studio rientra nella casistica di cui all’art 17/1/a - allegato 1/bis - D.L. 31/05/2021 n.77, come modificato dalla legge di conversione 29/07/2021 n.108 “opere, impianti e infrastrutture necessarie al raggiungimento degli obiettivi fissati dal PNIEC-PNRR”.

	Relazione elettrica	
	Progetto per la realizzazione di un impianto agrivoltaico denominato “Canalotto” per una potenza complessiva pari a 33,99 MW	

Premessa

Il presente studio, elaborato su incarico della società DREN SOLARE 9 srl, è stato redatto per l’attivazione della procedura di VIA di cui all’ art. 23 del D.Lgs 152/2006, al fine di ottenere l’Autorizzazione Unica ai sensi dell’art. 12 del D.Lgs 387/2003 e costituisce la relazione elettrica per la realizzazione di un parco agrivoltaico situato nel comune di Ciminna (PA) di potenza pari a 33,99 MW, progettato ai sensi delle Linee Guida emanate dal Ministero della Transizione ecologica – Dipartimento per l’Energia.

L’impianto, denominato “Gasena” dal toponimo del sito, è costituito da una centrale agrovoltaiica suddivisa in 6 sotto aree identificate dalla denominazione area A, area B, Area C, Area D, area E, area F. I pannelli prescelti hanno una potenza di 730W e saranno installati su tracker monoassiali con giunto cardanico in configurazione 2p. Ogni tracker sarà infatti composto da due file affiancate di 14 pannelli codauno, distanti dalla fila successiva di 5,5 m, misurati considerando i pannelli in assetto orizzontale.

La società proponente ha firmato un accordo con le imprese agricole proprietarie dei terreni su cui sorgerà il campo agro-fotovoltaico, che prevede lavorazioni tradizionali (erbaio), poiché è importante mantenere il carattere del luogo, oltre che rafforzare la produzione siciliana, effettuate tra i filari di tracker che garantirà l’assenza di consumo di suolo agricolo inteso come sottrazione di produzione alimentare¹; il piano colturale proposto valorizzerà da un punto di vista agronomico e paesaggistico il territorio locale. L’impianto è corredata da un sistema di accumulo di 13,4 MW. Il cavidotto, a partire dal campo, si snoderà per 1,6 Km nel territorio di Ciminna dove si collegherà, come previsto nella STMG accettata su proposta di Terna (codice pratica 202200282) in antenna a 36 kV con la sezione a 36 kV di una nuova stazione elettrica di trasformazione (SE) a 150/36 kV della RTN², da inserire in entra esce alle due linee RTN a 150kV RTN “Ciminna-Casuzze” e “Ciminna- Cappuccini” ricadente in area identificata al catasto dei terreni del Comune di Ciminna al foglio 19 particella n. 23. Il progetto nasce

dalla volontà di coniugare la questione energetica e il raggiungimento degli obiettivi del fabbisogno europeo con la tutela del paesaggio agrario³ attraverso un percorso di una economia circolare alla base di una corretta gestione delle risorse produttive in cui il principio di rinnovamento della materia generi (o salvaguardi) nuove economie creando differenti opportunità per il tessuto sociale con cui interagisce. Si premette che il progetto agrivoltaico, di cui qui di seguito si tratterà, rientra nella casistica di cui all’art 17/1/a - allegato 1/bis - D.L. 31/05/2021 n.77, come modificato dalla legge di conversione 29/07/2021 n.108 “opere, impianti e infrastrutture necessarie al raggiungimento degli obiettivi fissati dal PNIEC-PNRR”.

1. Definizione della connessione

1.1. Schema di inserimento

Lo schema di allacciamento alla RTN prevede che l'impianto venga collegato in antenna a 36 kV su una nuova Stazione Elettrica di trasformazione 150/36 kV della RTN, da inserire in entra – esce alle due linee RTN a 150 kV RTN “Ciminna – Casuzze” e “Ciminna – Cappuccini”.

2. Architettura dell'impianto

L'impianto sarà costituito da 46.564 moduli di manifattura TW Solar, di potenza nominale 730 W. La suddivisione dei moduli e la loro distribuzione in campo tiene conto del tipo di impianto che si intende realizzare. Nel caso in esame un impianto ad inseguitori mono assiali N-S, con esposizione moduli E-O e convertitori decentralizzati di stringa.

Il campo agrivoltaico ad inseguimento monoassiale sarà esposto con un orientamento azimutale a 90° rispetto al sud ed avrà un'incinazione rispetto all'orizzontale variabile con angolo da 0 a +/- 55° .

I 28 moduli che compongono la stringa unitaria saranno installati su singola tavola (array) doppia fila da 14 (2x14 portrait).

I moduli fotovoltaici saranno collegati a degli inverter centralizzati; in particolare per il lotto A+B è previsto l'impiego di un inverter da 4,7 MW (potenza DC 5,28 MW) della Gamesa Proteus; i lotti C+D+E, aventi potenza DC pari a 26,61 MW saranno utilizzati quattro inverter centralizzati della Gamesa Proteus da 4,7 MW e due inverter centralizzati da 4,1 MW.

Per il lotto F, invece, sono stati utilizzati 12 inverter di stringa KAKO da 165 kW.

Il sistema di distribuzione prevede cavidotti da 36 kV predisposti ad anello per il lotto C+D+E e due connessioni radiali, una per il lotto A+B e una per il lotto F.

La scelta di utilizzare gli inverter sopradetti e la loro potenza in funzione del sottocampo analizzato è stata eseguita dalla società proponente.

TEMPERATURE PARAMETERS

Temperature Coefficient (Pmax)	-0.26%/°C
Temperature Coefficient (Voc)	-0.24%/°C
Temperature Coefficient (Isc)	+0.04%/°C
NMOT	44±2°C

MAXIMUM RATINGS

Operational Temperature	-40°C~+85°C
Maximum System Voltage	1500V DC
Maximum Series Fuse Rating	35A
Power Output Tolerance	0~+5W
Maximum Bi-faciality	80±5%

MECHANICAL PARAMETERS

Cells	THC (N type Heterojunction Cell)
Cell Orientation	132[6X2]
Dimension	2384×1303×2X35mm
Weight	38.7kg
Front Glass	2.0mm high transmittance, AR semi-tempered glass
Rear Glass	2.0mm high transmittance, semi-tempered glass
Frame	Anodized aluminum alloy frame
Junction Box	IP68, 3 diodes
Output Cable	4.0mm ²
Cable Length	>400mm, -200mm, length can be customized
Wind/Snow Load	2400Pa/5400Pa
Packaging	31pcs per pallet, 558pcs per 40'HC

WARRANTY

The graph illustrates the linear power output warranty over a 30-year period. The y-axis represents the warranty percentage from 80% to 100%. The x-axis represents the year from 0 to 30. A straight line starts at 99.00% at year 0 and ends at 88.12% at year 30. A label indicates "1st year <1% annual degradation <0.375%".

I-V CURVE

The graph plots Current (A) against Voltage (V) for various conditions. The y-axis ranges from 0 to 18 A, and the x-axis ranges from 0 to 50 V. Multiple curves are shown for different combinations of cell temperature (25°C, 40°C, 50°C) and irradiance levels (200W/m², 400W/m², 600W/m², 800W/m², 1000W/m²). The curves generally show higher current at higher temperatures and higher irradiances.

3. Cavidotti MT e Storage

La tipologia di cavi utilizzati è di tipo AIRBAG e quindi la posa è direttamente interrata.

	Documentazione di progetto	 Emily Middleton & Partners srl
	Relazione elettrica	
	Progetto per la realizzazione di un impianto agrivoltaico denominato “Canalotto” per una potenza complessiva pari a 33,99 MW	

Per il ricoprimento dello scavo previsto per la posa di suddetto cavo si prevede l’impiego di sabbia o materiale vagliato proveniente dal medesimo scavo o scavi adiacenti, garantendo un ricoprimento di almeno 0.1 m sopra al tubo collocato più in alto. La sabbia o la terra vagliata sarà successivamente irrorata con acqua in modo da realizzare una buona compattazione.

Per il cavo in esame si specificano le condizioni di posa da osservare per non danneggiare il cavo in fase di installazione:

- Raggio minimo di curvatura per diametro (in mm): 20D
- Sforzo massimo di tiro: 50 N/mm²

In fase di rinterro vanno adottate tutte le cure e gli accorgimenti di rito al fine di evitare che i percorsi delle condutture elettriche divengano future vie di ruscellamento superficiale delle acque. Ciò avrebbe l’effetto di erodere gli strati di copertura delle sezioni di scavo. Inoltre, col tempo le successive infiltrazioni di acqua potrebbero asportare la sabbia di riempimento trasformando l’elettrodotto in una sorta di “canale”. Opportuni accorgimenti devono essere presi per fare sì che tale fenomeno non accada come:

- Garantire una profondità minima di posa di suddetto cavo, pari ad almeno 1,1 metri dal piano di calpestio (misurata dall’estradosso superiore del cavo).
- Segnalare la presenza del cavo, adottando un nastro monitore ad almeno 0.2 m dall’estradosso superiore del cavo;
- Ricoprendo con terra vagliata (fino ad almeno 0.1 m sopra al cavo collocato più in alto).

Lungo tutti gli scavi è prevista la posa di cavo ottico dielettrico a 24 fibre ottiche per posa in tubazione rispondente alla tabella di unificazione “DCFO02” e dalla norma “ITU-T/G.652” comprensivo di certificati di collaudo: tale cavo di segnale sarà utilizzato per la trasmissione dei segnali via modem tra le singole unità.

Il cavo in fibra ottica deve essere posato in canalizzazione realizzata sul tracciato del cavo elettrico mediante l’impiego di mono-tubo in PEHD e, dove necessario, di pozzi in CLS per consentire il

Rev. 00 – Dicembre 2023	Comune: Ciminna Provincia: Palermo	Pag. 7
----------------------------	---------------------------------------	--------

	Documentazione di progetto	 Emily Middleton & Partners srl
	Relazione elettrica	
	Progetto per la realizzazione di un impianto agrivoltaico denominato “Canalotto” per una potenza complessiva pari a 33,99 MW	

tiro ed il cambio di direzione del cavo e l’alloggiamento dei giunti e della ricchezza di scorta del cavo. Le giunzioni interrate sul cavo in fibra ottica saranno conformi alla specifica DM3301.

In ottemperanza ai dettami della norma CEI 11- 17 sezione 4.3:

- “durante le operazioni di posa o di spostamento dei cavi per installazione fissa, la loro temperatura per tutta la loro lunghezza e per tutto il tempo in cui essi possono venire piegati o raddrizzati non deve essere inferiore a 0°C”
- “durante le operazioni di posa dei cavi per installazione fissa, se non altrimenti specificato dalle norme particolari dei costruttori, i raggi di curvatura dei cavi, misurati sulla generatrice interne degli stessi, non devono essere inferiori a 12D (per cavi senza alcun rivestimento metallico) dove D è il diametro esterno del cavo”
- “gli sforzi di tiro necessari durante le operazioni di posa dei cavi non vanno applicati ai rivestimenti protettivi, bensì ai conduttori, per i quali d’altronde si raccomanda di non superare una sollecitazione di 50 N/mm² per conduttori di alluminio”

Le precauzioni riportate sono necessarie al fine di evitare che, durante le operazioni di posa, il cavo si danneggi e conseguentemente si alteri la capacità a svolgere il compito per cui è predisposto. Le stesse vanno integrate con quelle dei costruttori, riportare sulla documentazione tecnica a corredo dei prodotti che, qualora più restrittive, hanno valenza superiore. Inoltre, è opportuno che l’installatore conservi e fornisca quanto necessario a dimostrare l’avvenuto rispetto delle prescrizioni in questione (per esempio le temperature e le condizioni presenti durante la posa e la permanenza in magazzino dei prodotti).

Gli accessori dei cavi devono essere idonei a sopportare le sollecitazioni elettriche, termiche e meccaniche previste durante l’esercizio in condizioni ordinarie e anomale. In particolare, ai sensi della CEI 11-17 punto 7.1.3 devono poter sopportare le correnti di cortocircuito previste per la sezione dei conduttori, delle guaine e degli schermi dei cavi su cui vengono montati. Vale in proposito la

Rev. 00 – Dicembre 2023	Comune: Ciminna Provincia: Palermo	Pag. 8
----------------------------	---------------------------------------	--------

	Documentazione di progetto	 Emily Middleton & Partners srl
	Relazione elettrica	
	Progetto per la realizzazione di un impianto agrivoltaico denominato “Canalotto” per una potenza complessiva pari a 33,99 MW	

considerazione riportata nella suddetta norma circa le prove necessarie a qualificare l'accessorio come idoneo.

La tensione di designazione degli accessori deve essere almeno uguale alla tensione nominale del sistema. Le terminazioni devono rispettare le prescrizioni dei produttori di quadri e inverter. Il giunto va adagiato sul fondo dello scavo in modo da avere nel piano di posa un supporto continuo per la sua intera lunghezza; quindi, va ricoperto di uno strato di sabbia del tipo a bassa resistività, del tipo silicea preferibilmente verificata previa misura, aggiungendo altro materiale simile sino a sovrastare la sommità di almeno 10 cm.

Per i giunti si utilizzeranno giunzioni termorestringenti. L'ubicazione sarà segnalata sulle planimetrie riportanti il percorso dei cavi in modo tale che sia possibile una rapida e sicura individuazione futura. La norma CEI 11- 17 sezione 8 raccomanda che, prima della messa in servizio, sia eseguito un controllo allo scopo di assicurarsi che il montaggio degli accessori sia stato eseguito senza difetti e che i cavi non siano stati deteriorati durante la posa.

Per la descrizione delle prove da eseguire si rimanda alla sezione della norma citata.

Il cavidotto utilizzato per il dimensionamento dei cavi è il cavidotto della Nexans – ARE4H5EE up to 36 kV.

L'anello di connessione dei campi C+D+E è costituito da una doppia terna da 500 mmq; il collegamento radiale al campo A+B è costituito da una singola terna da 185 mmq, mentre il collegamento radiale del campo F è costituito da una singola terna da 150 mmq.

Tra la Cabina di raccolta “E” e la Cabina di raccolta Storage è previsto un collegamento con cavo ARE4H5EE SK2 36 kV in semplice terna da 3x1x400 mmq.

Il progetto è corredata da 4 Battery Inverter Gamesa Proteus PCS 3150E, collegati ai pacchi batterie mediante 6 coppie bifase di cavo ARG16G16 da 400 mmq. In tal modo con scarica da 3MW per ogni pacco batteria e livello di tensione nell'intorno dei 1.200 V si ottiene una corrente BT di circa 2500 A.

Rev. 00 – Dicembre 2023	Comune: Ciminna Provincia: Palermo	Pag. 9

	Documentazione di progetto	 Emily Middleton & Partners srl
	Relazione elettrica	
	Progetto per la realizzazione di un impianto agrivoltaico denominato “Canalotto” per una potenza complessiva pari a 33,99 MW	

La connessione tra il parco e la SE è realizzato con due terne MT ARE4H5EE SK2 36 kV da 500 mmq.

4. Opere civili propedeutiche alle opere elettriche

La realizzazione delle infrastrutture elettriche richiederà la realizzazione delle seguenti opere:

- opere civili di fondazione;
- opere per la posa dei cavidotti.

4.1. Opere civili di fondazione

Tali opere possono ascriversi all'interno del campo alla realizzazione del piano di posa degli inverter e degli storage.

4.2. Opere per la posa dei cavidotti

I cavi, come detto, internamente al campo sono in posa interrata, le opere riguardano lo scavo per la realizzazione delle trincee di posa. All'esterno del campo le opere fanno riferimento allo scavo in trincea per la posa del cavidotti tra le aree e la cabina di raccolta e tra la cabina di raccolta e la SE.

MEDIUM VOLTAGE CABLE

SINGLE CORE CABLE WITH ALUMINIUM CONDUCTOR, REDUCED THICKNESS XLPE INSULATION, ALUMINIUM TAPE SCREEN AND DOUBLE PE SHEATH, **SHOCK RESISTANT**.

APPLICATIONS AND CHARACTERISTICS

In MV energy distribution networks for voltage systems **up to 36kV**.
Suitable for fixed installation indoor or outdoor laying in air or directly or indirectly buried, also in wet location.

SHOCK PROOF SK2 has a very good shock resistance characteristics.
The two special outer sheaths provide an excellent protection against impact and mechanical abuse during the lifetime of the cable.
Shock Proof SK2 cable performances has been evaluated against mechanical protection by the abrasion test and the impact test included in CEI 20-68 standard.

This type of cable can be directly buried without additional protections because it is comparable to an armoured cable.

FUNCTIONAL CHARACTERISTICS

Rated voltage U_0/U :	18/30 kV
Maximum voltage U_m :	36 kV
Test voltage:	3,5 U_0
Max operating temperature of conductor:	90 °C
Max short-circuit temperature:	250 °C (for max 5 s)
Max short-circuit temperature (screen):	150 °C

CONSTRUCTION

1. Conductor
stranded, compacted, round, **aluminium** - class 2 acc. to IEC 60228
2. Conductor screen
extruded semiconducting compound
3. Insulation
extruded cross-linked polyethylene (**XLPE**) compound
4. Insulation screen
extruded semiconducting compound - **fully bonded**
5. Longitudinal watertightness
semiconducting **water blocking tape**
6. Metallic screen and radial water barrier
aluminium tape longitudinally applied (nominal thickness = 0,20 mm)
7. First sheath - 1
extruded **PE** compound
8. Second sheath - 2
extruded **PE** compound - colour: **red**
with improved **impact resistance**

Max pulling force during laying

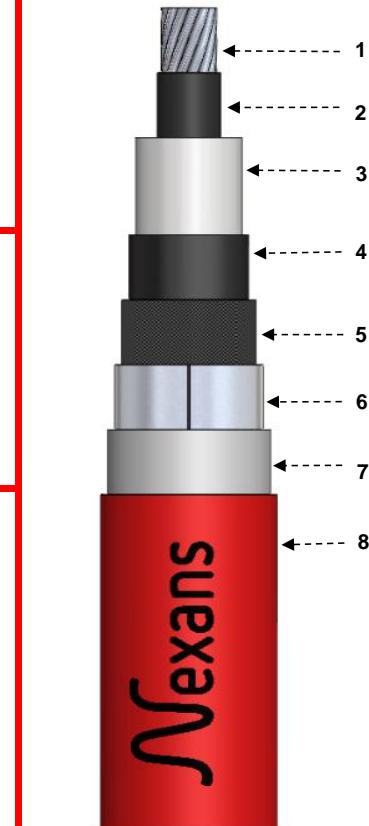

50 N/mm² (applied on the conductors)

Min bending radius during laying

14 D_{cable} (dynamic condition)

Minimum temperature during laying

- 25 °C (cable temperature)

STANDARDS

IEC 60502-2 where applicable (*testing*)
CEI 20-68 where applicable (*impact test*)
HD 620-10G where applicable (*insulation thickness*)

MARKING

by ink of the following legend:
"NEXANS B <Year> ARE4H5EE 18/30kV 1x <S> SK2 <meter marking>"

<Year> = year of manufacturing

<S> = section of the conductor

Mechanical resistance to impacts: **very good**
(CEI 20-68)

Longitudinal waterproof

Radial waterproof

Max operating temp. of conductor: 90 °C

Max short-circuit temperature : 250 °C

Minimum installation temperature: -25 °C

Gamesa Electric Proteus PCS-E 1500V Battery Inverters

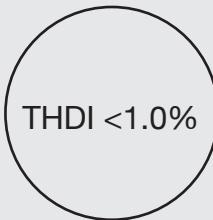

High DC
short-circuit
capacity

High
power
capability up
to 1500Vdc

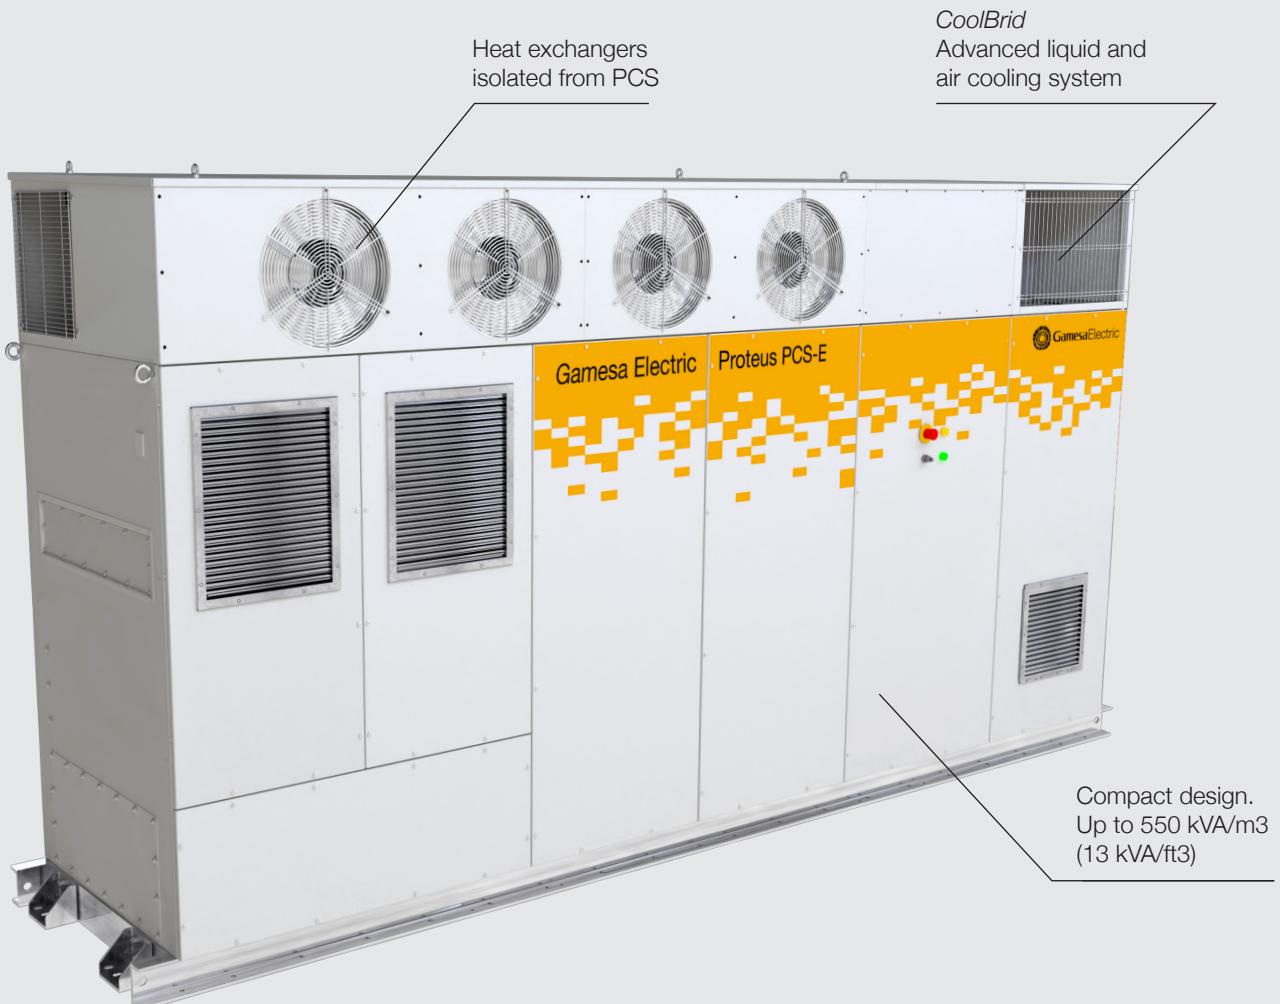

THDI <1.0%

High
efficiency

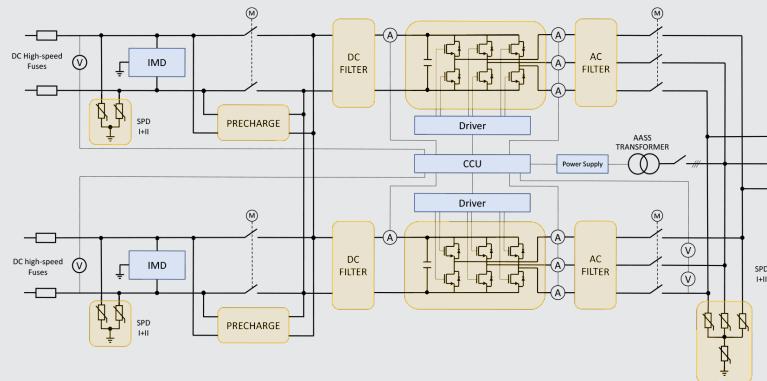

Outdoor
solution

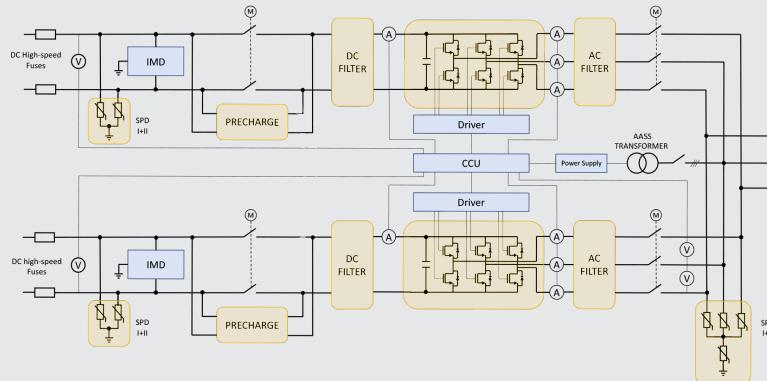

Proteus PCS-E Inverters combine reliability and robustness, efficiency, compactness and high power capability at 1500Vdc, all for a minimum LCoS

Different product configurations available to optimize performance in demanding environments as well as different voltage levels to fit customers' needs.

**SINGLE BUS
CONFIGURATION**

**DOUBLE BUS
CONFIGURATION**
Capacity to manage two independent batteries

Gamesa Electric Proteus PCS-E 1500V Battery Inverters

High Round Trip Efficiency (RTE)

High efficiency that allows to improve the overall system RTE and LCoS.

Smart liquid/air cooling system that allows critical components to work at temperature level far below their limits, guaranteeing longer product lifespan and lower thermal losses

Low power derating

High power capacity at 1500Vdc

Wide operating temperature range

Grid connection

Four quadrant operation for full active and reactive power support to comply with the most demanding grid codes

Weak grid and micro-grid configuration with a seamless transition and black start capability

Fast frequency response

Synthetic inertia

Grid forming in parallel operation with the grid

Battery oriented

Safety centered design with high speed control and monitoring.

Double power module topology for two independent battery connections allowing for much higher DC short-circuit currents and increased system availability

Battery agnostic design to accommodate different battery technologies up to 1500Vdc, including: li-ion, lead-acid, flow and others

TDHI <1%

One-way
efficiency
99.45%

Outdoor
solution

Gamesa Electric Proteus PV Station

Better LCoE

Largest single inverter power block in the market with 4,700 KVA

Fewer inverters per project thus lower Capex and Opex

DC/AC ratio of up to 200%

Higher yield

Market-leading efficiency with 99.45%

THDi < 1% which reduces losses

Enhanced temperature derating: keeping full power up to 40°C [104°F]

Built to last

Designed and manufactured for a 30 year life span

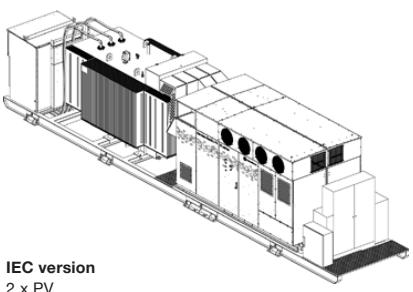

CoolBrid: Smart hybrid cooling system that allows critical components to work far below the temperature limit

Lowest THDi in the market helps to extend power transformers lifespan

Gamesa Electric Proteus PV Inverters

Maximum energy and versatility
for utility-scale projects

Up to 200%
DC/AC ratio

TDHI <1%

MPPT
efficiency
99.9%

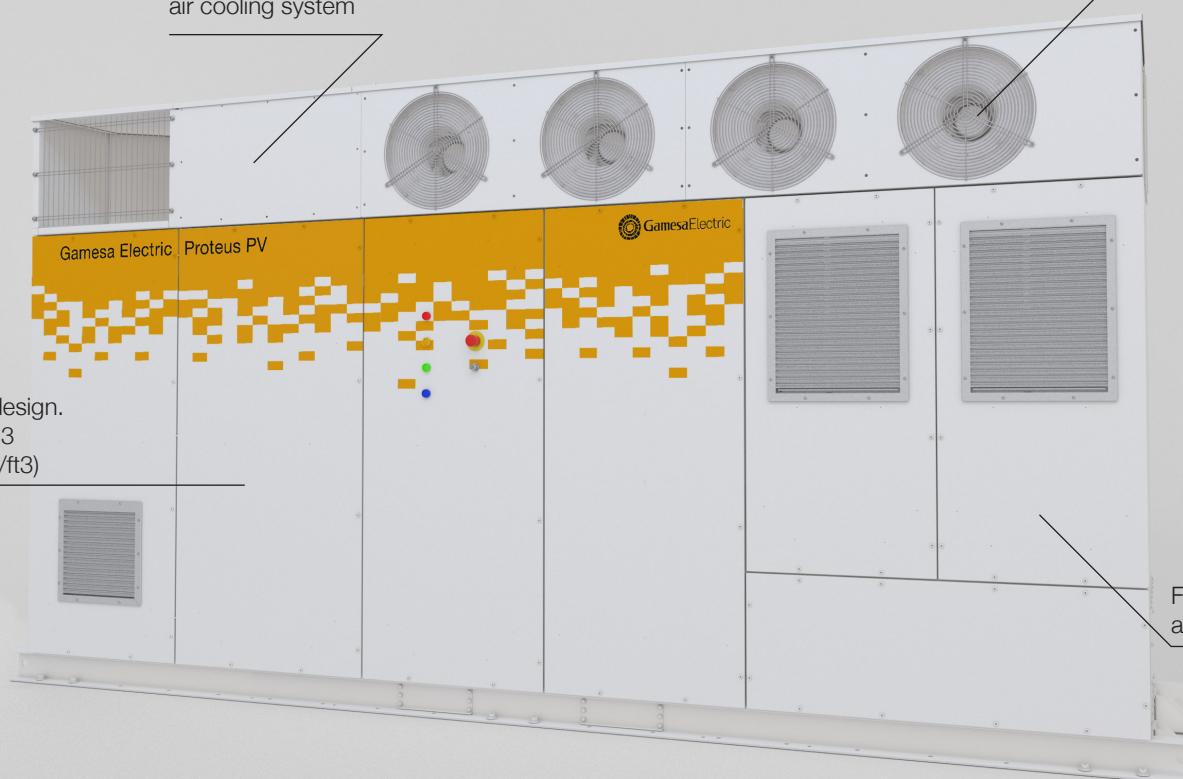

Outdoor
solution

CoolBrid
Advanced liquid and
air cooling system

Heat exchangers

Compact design.
473 kVA/m³
(11.18 kVA/ft³)

Field-proven
and reliable CCU

Gamesa Electric Proteus PV Inverters

Better LCoE

Largest single inverter
power block in the market
with 4,700 KVA

Fewer inverters per project
thus lower Capex and Opex

DC/AC ratio of up to 200%

Higher yield

Market-leading efficiency
with 99.45%

THDi < 1% which reduces
losses

Enhanced temperature
derating: keeping full power
up to 40°C [104°F]

Built to last

Designed and manufactured
for a 30 year life span

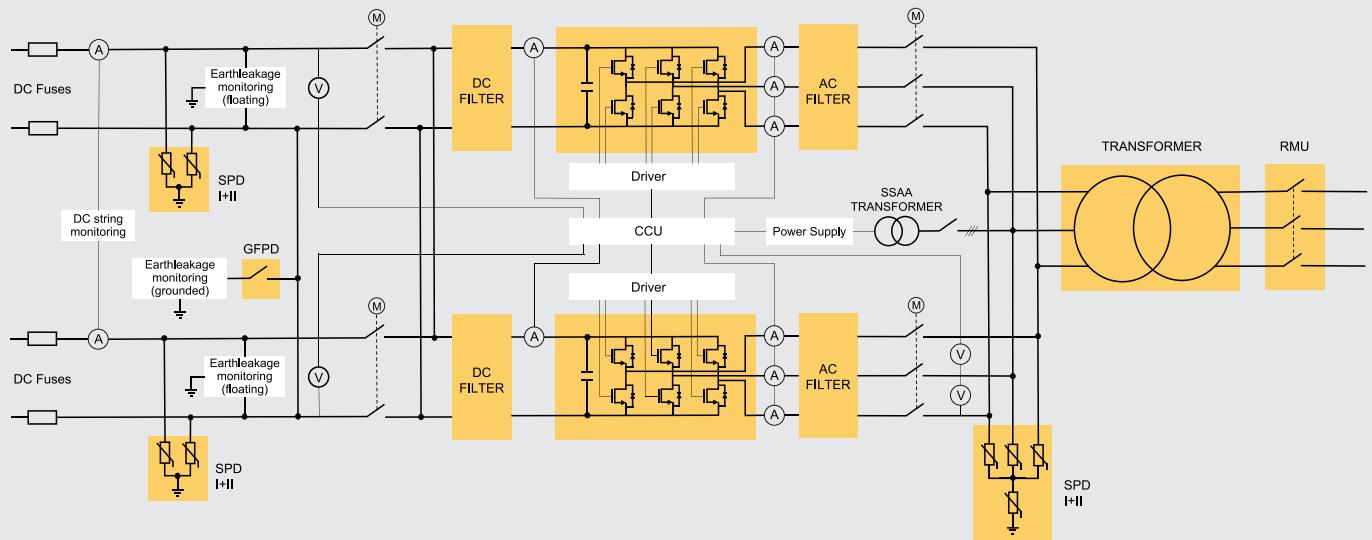

CoolBrid: Smart hybrid
cooling system that allows
critical components to work
far below the temperature
limit

Lowest THDi in the market
helps to extend power
transformers lifespan

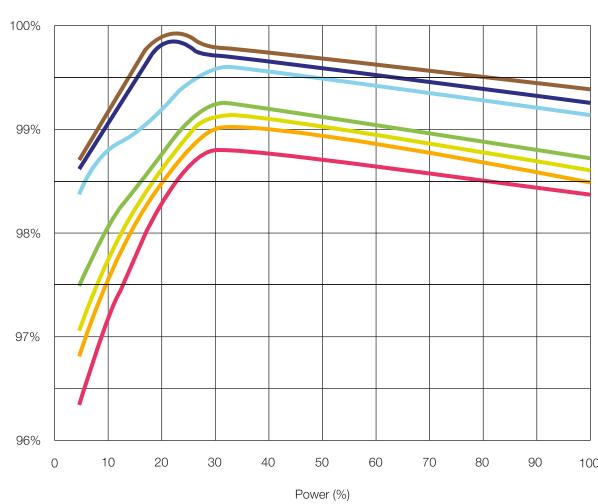

The Gamesa Electric Proteus PV Inverters combine high power with maximum versatility for PV plants LCoE reduction.

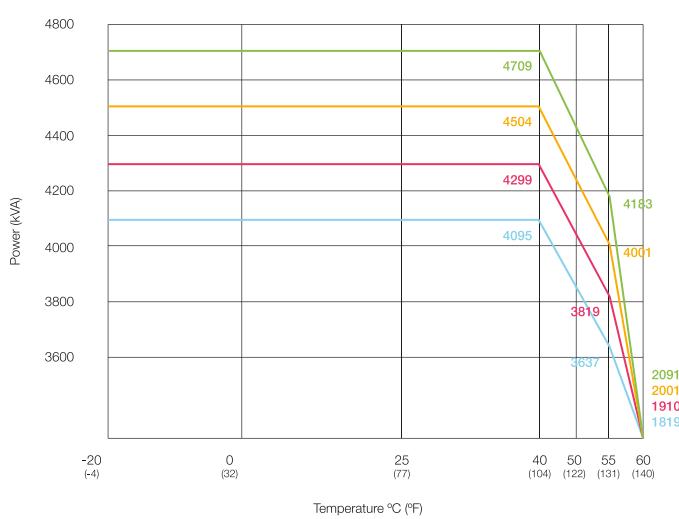

Different product configurations available to optimize performance in demanding environments as well as different voltage levels to fit customers' needs.

Efficiency

Configurations Up to 4700 kVA

Legend for PV Configurations:

- 1300 Vdc

blueplanet 125 - 150 TL3

String inverters for utility-scale solar power plants
up to multi-megawatt solar parks.

Decently into new dimensions.

Superior efficiencies and
overload capacity through silicon
carbide technology

Special properties for extreme
environmental conditions

Decentralised design or 'Virtual
Central' concept possible

Overvoltage protection AC/
DC and for communication
interfaces available

Lean commissioning and updates
via remote services

Technical Data

DC input data	125 TL3	137 TL3
Max. recommended PV generator power	187 500 W	205 500 W
MPP range	875 – 1 300 V	875 – 1 300 V
Operating range	875 – 1 450 V	875 – 1 450 V
Rated DC voltage / start voltage	900 V / 1 000 V	900 V / 1 000 V
Max. no-load voltage	1 500 V	1 500 V
Max. input current	160 A	160 A
Max. short circuit current $I_{sc\ max}$	300 A	300 A
