| | IG51-02-E-CV-CL-GA1M-0X-002-A00 Relazione di calcolo uscite di sicurezza | Foglio 7 di 2636 |

1. INTRODUZIONE

La presente relazione di calcolo ha come oggetto le analisi di calcolo strutturale inerenti le uscite di sicurezza poste al km 41+800 circa poste a servizio della galleria artificiale di Pozzolo, inserita nella tratta A.V./A.C. Milano-Genova – Terzo valico dei Giovi. Nel presente documento si riportano le valutazioni ed i calcoli condotti per il dimensionamento delle opere strutturali e geotecniche nell'ambito della realizzazione delle opere relative alla WBS GA1M.

In generale la galleria artificiale in questione si sviluppa tra le progr. Km 40+794.00 e 42+778.80 per una lunghezza totale pari a 1984.8 m. La costruzione del manufatto interferisce con alcune preesistenze quali strade provinciali, strade campestri e rii che saranno provvisoriamente deviati in corso d'opera, per poi essere nuovamente ubicati, al termine dei lavori, secondo il loro assetto ante-opera. Il progetto di tali interferenze è stato sviluppato nei relativi elaborati grafici, a cui si rimanda per ogni dettaglio.

Gli spazi previsti, ai fini della risoluzione delle interferenze, per le deviazioni provvisorie (distanza tra la deviazione temporanea e la chiusura provvisoria di scavo della galleria artificiale) sono ritenuti sufficienti per la corretta realizzazione dell'opera e per la sua esecuzione in condizioni di sicurezza.

Per quanto attiene alla galleria artificiale, oltre le verifiche strutturali, di seguito sono inoltre illustrati l'inquadramento geotecnico dell'opera, le metodologie di intervento e le fasi costruttive.

Le analisi strutturali, le verifiche di resistenza e quelle di fessurazione sono condotte secondo il metodo semiprobabilistico agli stati limite in accordo con il Rif.(03) Sezione II, ed in accordo con gli altri riferimenti citati al capitolo successivo.

La suddetta galleria artificiale si articola in 2 distinte tipologie strutturali:

- da progr. km 40+794.00 a 42+400.80: galleria artificiale realizzata con metodo *cut and cover* (L=1606.8 m);
- da progr. km 42+400.80 a 42+778.80: galleria artificiale tra diaframmi (L=378.0 m).

Il tratto di galleria artificiale con le uscite di sicurezza è posto tra la km 41+775.78 e la km 41+800.88 circa, infatti alle suddette chilometriche sono presenti dei giunti strutturali. In tale tratto la galleria è realizzata col metodo *cut and cover* laddove lo scavo è realizzato a cielo aperto con successivo getto in opera della struttura in artificiale in c.a. a scatolare con ritombamento finale.

E' altresì prevista l'esecuzione di un sistema di abbattimento della falda al di sotto del piano di scavo generale.

L'area d'interesse ricade in zona sismica di III° categoria. Corrispondentemente, si è adottato un grado di sismicità S=6, cui corrisponde un coefficiente di intensità sismica pari a 0.04.

2. NORMATIVA DI RIFERIMENTO

Il progetto è eseguito nel rispetto della seguente normativa:

- (01) Legge 5/11/1971, n. 1086** – “Norme per la disciplina delle opere di conglomerato cementizio armato, normale e precompresso ed a struttura metallica”
- (02) D.M. 11/03/1988** – “Norme tecniche riguardanti le indagini sui terreni e sulle rocce la stabilità dei pendii naturali e delle scarpate, i criteri generali e le prescrizioni per la progettazione l’esecuzione ed il collaudo delle opere di sostegno delle terre e delle opere di fondazione”
- (03) D.M. 09/01/1996** – “Norme tecniche per il calcolo, l’esecuzione ed il collaudo delle strutture in cemento armato, normale e precompresso e per le strutture metalliche”
- (04) D.M. 16/01/ 1996** – “Norme tecniche per le costruzioni in zone sismiche”
- (05) Istruzioni F.S. I/SC/PS-OM/2298** – “Sovraccarichi per il calcolo dei ponti ferroviari. Istruzioni per la progettazione, l’esecuzione ed il collaudo”. Testo aggiornato della istruzione n. I/SC/PS-OM/2298 del 2 giugno 1995 completo delle relative integrazioni emanate dall’ASA SERVIZI DI INGEGNERIA delle F.S. del 13.01.1997
- (06) Istruzione F.S. 44b** del 14.11.1996 – “Istruzioni tecniche per manufatti sotto binario da costituirsi in zona sismica”
- (07) ITALFERR SIS. T.A.V.** – “Sistema Alta velocità- Manuale di progettazione”
- (08) S.T.I. direttiva 2008/163/CE** – Specifica tecnica di interoperabilità concernente la “sicurezza nelle gallerie ferroviarie” nel sistema ferroviario trans europeo convenzionale e ad alta velocità
- (09) D.M. 09//03/2007** – Prestazioni di resistenza al fuoco delle costruzioni nelle attività soggette al controllo del Corpo nazionale dei vigili del fuoco
- (10) D.M. 28//10/2005** – Sicurezza nelle Gallerie Ferroviarie
- (11) UNI EN 1992-1-2** – Eurocodice 2 Progettazione delle strutture di calcestruzzo Parte 1-2 Regole generali Progettazione strutturale contro l’incendio
- (12) O.P.C.M. 20/03/2003 n.3274** – Primi elementi in materia di criteri generali per la classificazione sismica del territorio nazionale e di normative tecniche per le costruzioni in zona sismica.

3. CARATTERISTICHE DEI MATERIALI

Il progetto è stato sviluppato con riferimento ai seguenti materiali aventi le caratteristiche meccaniche minime di seguito riportate:

3.1. Galleria artificiale cut and cover

3.1.1. Travi prefabbricate in c.a.

- Calcestruzzo:
 - Classe di resistenza: C35/45
 - Classe di esposizione: XF1
 - Classe consistenza slump: S5
- Acciaio barre armatura: B450C
- Copriferro: ≥ 30 mm

3.1.2. Getto di completamento della soletta superiore, pareti verticali e soletta di base

- Calcestruzzo:
 - Classe di resistenza: C32/40
 - Classe di esposizione: XC1
 - Classe consistenza slump: S3÷S5
- Acciaio barre armatura: B450C
- Copriferro: ≥ 40 mm

4. PROFILO STRATIGRAFICO E STRATIGRAFIA DI PROGETTO

4.1. Indagini in sito considerate

Nella zona della galleria artificiale in oggetto, sono stati eseguiti una serie di sondaggi geotecnici a carotaggio continuo. La denominazione dei sondaggi di cui sopra, nonché le rispettive profondità raggiunte, sono riportate nella tabella seguente.

| Sondaggi a carotaggio | | |
|-----------------------|--------------------------------|------------------|
| Denominazione | Quota assoluta (m s.l.m.m.) | Lunghezza (m) |
| XA301R068 | 168.07 | 30 |
| SA301C069 | 166.82 | 40 |
| SA301R070 | 162.95 | 30 |
| XA301R071 | 161.35 | 30 |
| XA301U072 | 159.60 | 40 |
| XA301C073 | 157.10 | 40 |
| SA301R074 | 154.60 | 30 |
| XA301R075 | 154.10 | 30 |

Tabella 4-1. Sondaggi nell'area di realizzazione della galleria artificiale

Nell'area è stata effettuata una campagna integrativa (2005) allo scopo di completare le informazioni geotecniche con un maggiore grado di dettaglio.

La campagna ha visto la realizzazione di una serie di sondaggi geognostici, prove in sito in corrispondenza degli stessi (SPT e prove Lefranc, principalmente) ed il prelievo di campioni per l'esecuzione di prove di laboratorio.

4.2. Stratigrafia e condizioni di falda

Sulla base dei dati disponibili, la situazione stratigrafica del sito può essere così schematizzata:

- A partire dal piano campagna locale si può incontrare uno strato superficiale di terreno di riporto/agricolo costituito da limo sabbioso marrone scuro di spessore pari a 1.00÷2.00 m circa, localmente inglobante elementi lapidei sparsi (Formazione LS).
- Al di sotto della Formazione LS/LA e fino alle massime profondità indagate è presente un deposito di origine alluvionale postglaciale (Olocene) fl3 costituito da ghiaia medio grossa in matrice limo-sabbiosa (Formazione GL) con frazione limosa crescente con la profondità.

Le prove SPT hanno fornito gli intervalli di valori riportati nella seguente tabella.

| | | | |

| Cut & cover | | | | | | Scavo fra diaframmi | | | | | |

Tabella 4-3. Dettaglio risultanze delle prove SPT in foro nell'area dell'opera GA1M (campagna 2005)

Alla luce di quanto sopra, la stratigrafia di progetto da utilizzarsi nelle verifiche geotecniche è la seguente:

| Stratigrafia di calcolo | Da (m da p.c.) | A (m da p.c.) | Tipo di terreno |
|-------------------------|----------------|---------------|---------------------------------------|
| LS/LA | p.c. | - 2.00 | Limo sabbioso |
| GL | - 2.00 | In poi | Ghiaia medio grossa in matrice limosa |

Tabella 4-4. Stratigrafia di progetto per l'area in esame

4.3. Livello piezometrico

Il livello di falda rilevato dai piezometri installati nei sondaggi non è uniforme lungo il tracciato della galleria e tende ad approfondirsi in direzione sud-nord. In particolare il livello di soggiacenza massima varia tra -3.2 m da p.c. intorno alla pk. 40+500 (Sondaggio XA301R068) e - 6.1 m da p.c. a partire dalla pk. 42+100 circa (Sondaggi XA301U072, XA301C073 e XA301R075), mentre il livello di soggiacenza minima varia tra -4.70 m da p.c. e -13.30 m da p.c. in corrispondenza delle medesime progressive.

| | Foglio 12 di 2636 |

4.4. Parametrizzazione geotecnica e stratigrafia di progetto

Di seguito si forniscono i parametri di base per i materiali geotecnici nell'area in esame.

| Parametri | Formazione LS/LA | Formazione GL |
|---|---------------------|------------------|
| Peso di volume γ (kN/m ³) | 18 | 19 ÷ 20 (1) |
| Densità relativa D_r (%) | - | 73 ÷ 95 |
| Coesione drenata c' (kPa) | 5 | - |
| Angolo di resistenza al taglio operativo ϕ' (°) | 26 | 44-0.1·Z (2) (3) |
| Velocità delle onde di taglio V_s (m/s) (4) | - | 185 + 3.9·z (3) |
| Modulo di taglio a piccole deformazioni G_0 per materiali granulari (MPa) | - | 75 + 3.85·z (3) |
| Modulo di Young a piccole deformazioni E_0 per materiali granulari (MPa) | - | 190 + 10·z (3) |

(1) Valori crescenti con la profondità.

(2) Valori decrescenti con la profondità.

(3) Z = Profondità da piano campagna in m.

(4) Valori delle velocità delle onde di taglio ricavate dai dati SPT secondo la correlazione di Ohta e Goto.

Tabella 4-5. Caratteristiche di base dei materiali geotecnici

La campagna di indagini 2005 ha fornito informazioni aggiuntive, permettendo di distinguere in zone omogenee le varie tratte realizzative lungo il tracciato nell'area in esame.

In particolare, si osserva come nella tratta fra paratie i parametri geotecnici risultino, quantomeno dalle prove di laboratorio, inferiori rispetto a quelli delle zone adiacenti.

5. METODOLOGIE DI INTERVENTO E FASI COSTRUTTIVE

Per la realizzazione della galleria artificiale nel tratto con le uscite di sicurezza viene impiegato il sistema costruttivo con scavo a cielo aperto, eseguito mediante l'ausilio di pozzi e trincee drenanti per l'abbattimento temporaneo della falda al di sotto del piano di scavo generale. Tale tipologia di opera viene impiegata nel tratto compreso fra le progr. km 40+794.00 e 42+400.80 dove è possibile eseguire un ampio scavo di sbancamento senza interferire con strade, ferrovie, edifici.

L'opera si sviluppa per una lunghezza di 1606.8 m e si articola nelle seguenti fasi costruttive:

- Scavo di sbancamento fino a quota falda;
- Esecuzione pozzi di emungimento e trincee drenanti finalizzati all'abbattimento della falda fino al livello del piano di scavo generale;
- Esecuzione delle trincee di scavo fino al piano del fondo scavo generale, con realizzazione di ulteriori livelli di trincee di scavo;
- Formazione del sottofondo in cls magro, posa impermeabilizzazione e getto della soletta di base in c.a., getto delle pareti verticali in c.a., realizzazione della soletta di copertura mediante travi prefabbricate in c.a. accostate con getto in c.a. di completamento e solidarizzazione in opera, impermeabilizzazione pareti e soletta;
- Riempimento parziale e dismissione dei pozzi di emungimento;
- Completamento del reinterro;
- Realizzazione delle opere ferroviarie in galleria.

La soletta di base in c.a. ha uno spessore di 1.40 m, le pareti verticali in c.a. sono spesse 0.90 m, mentre la soletta di copertura è costituita da travi a T prefabbricate in c.a. alte 1 m che vengono accostate e solidarizzate mediante getto di completamento in opera in c.a. per portarla ad uno spessore finale di 1.20 m.

6. DIMENSIONAMENTO E VERIFICA

6.1. Tipologia di analisi condotte e modelli di calcolo impiegati

Dal punto di vista costruttivo dapprima si realizzerà la soletta inferiore, poi i piedritti ed infine si saranno posizionate le travi prefabbricate con il successivo getto integrativo.

In virtù della notevole complessità strutturale dell'opera e della forte interazione terreno-strutture, si è adottato un approccio in grado di cogliere le problematiche connesse all'interferenza della falda (ipotizzata a diversi livelli di quota) sia le problematiche inerenti il comportamento delle strutture nei confronti delle sollecitazioni, rispettivamente in condizioni di esercizio e sisma, che caratterizzeranno la vita delle opere strutturali stesse.

Per il raggiungimento dei suddetti obiettivi sono stati predisposti due distinti modelli agli elementi finiti con riferimento alle sezioni di calcolo precedentemente definite, utilizzando in maniera integrata un software tipicamente strutturale quale STRAUS7 v.2.4.5 della G+D Computing.:

- Un modello per l'esecuzione di un'analisi piana che considera un'intera sezione trasversale corrente composta dall'uscita di sicurezza di destra – dalla galleria ferroviaria – dall'uscita di sicurezza di sinistra (vedi *Figura 2*);
- Un modello per l'esecuzione di un'analisi tridimensionale della reale carpenteria dell'opera che considera una sola uscita di sicurezza, con l'inserimento di opportuni vincoli di interfaccia tra galleria ferroviaria e uscita di sicurezza (vedi *Figura 1*) ;

SEZIONE TRASVERSALE F-F

SEZIONE TRASVERSALE G-G

|---|--|-------------------------|
| GENERAL CONTRACTOR  | ALTA SORVEGLIANZA  | |
| | IG51-02-E-CV-CL-GA1M-0X-002-A00 Relazione di calcolo uscite di sicurezza | Foglio 17 di 2636 |

L'utilizzo di tale strumento di calcolo consente di simulare in maniera adeguata sia l'interazione terreno-struttura e l'effetto con la falda, nonché di tenere in considerazione quegli aspetti tipici di una struttura fuori terra quali ritiro, dilatazione termica ed interferenza con i carichi accidentali ferroviari opportunamente simulabili con uno strumento specificamente dedicato (Analisi con STRAUS7) molto flessibile nelle fasi di combinazione ed inviluppo dei carichi.

L'interazione tra terreno e struttura è stata simulata definendo un supporto elastico la cui rigidezza è funzione della rigidezza del terreno e della struttura che insiste sullo stesso.

6.2. Descrizione delle analisi con STRAUS7

6.2.1. Introduzione

L'analisi del comportamento della struttura e dello stato di sforzo sono stati elaborati mediante tale software. Esso infatti da la possibilità gestire diverse condizioni di carico, permanenti ed accidentali, e la possibilità di sovrapporre e combinare opportunamente le singole condizioni di carico secondo le vigenti normative.

Nel dettaglio si è realizzato un modello considerando agenti i carichi permanenti dovuti ai pesi propri ed alle spinte del terreno tenendo conto delle possibili escursioni della falda, dei variabili legati al traffico ferroviario ed alla possibile presenza della folla o di altri mezzi, degli eccezionali legati al traffico ferroviario come da normativa ferroviaria.

Si tiene conto che in prima fase le travi di copertura delle gallerie lavorano secondo uno schema statico appoggio – appoggio mentre in seconda fase con il getto di solidarizzazione si ha continuità tra i vari elementi strutturali costituenti lo scatolare.

La reazione vincolare della prima fase legata al peso proprio delle travi e del getto di completamento in c.a. non ancora maturato vengono applicate nel modello come azioni permanenti direttamente sui piedritti.

I vincoli applicati alla platea sono costituiti da un sistema di molle (support) verticali di opportuna rigidezza assiale che schematizzano l'interfaccia tra il terreno e la soletta di fondazione. Il valore di tale molla elastica è pari a 3.53 kg/cm^3 .

Non sono previsti vincoli rispetto alla traslazione orizzontale ma un sistema di molle (translational stiffness di entità pari a 10% di quelle verticali)

Per ciascun elemento costituente il modello vengono opportunamente definite le caratteristiche geometriche (B, H), il materiale, il modulo elastico e l'inerzia flessionale.

| | IG51-02-E-CV-CL-GA1M-0X-002-A00 Relazione di calcolo uscite di sicurezza |
| | Foglio 18 di 2636 |

Come già precedentemente descritto sono stati realizzati due modelli agli elementi finiti.

Nel primo modello piano si riprendono le sezioni studiate considerando uno schema a linea d'asse, mediante l'utilizzo di elementi beam considerando una profondità di 100 cm: i carichi applicati e le sollecitazioni generate sono stati quindi valutati su questa profondità. Sono stati analizzati i comportamenti della solette superiore, inferiore e dei piedritti secondo uno schema che prevede la continuità (incastro) all'interfaccia tra questi elementi.

Nel secondo modello tridimensionale si riprendono le sezioni studiate considerando uno schema a piastra, mediante l'utilizzo di elementi plate considerando quindi le reali dimensioni degli elementi in ogni direzione: i carichi applicati e le sollecitazioni generate sono stati quindi valutati e applicati a metro quadrato. Sono stati analizzati i comportamenti della solette superiore, inferiore, dei piedritti e delle pareti verticali e orizzontali interne secondo uno schema che prevede la continuità (incastro) all'interfaccia tra questi elementi e applicando dei vincoli all'interfaccia galleria-uscita di sicurezza che bloccano gli spostamenti orizzontali, ma lasciano liberi gli spostamenti verticali.

6.2.2. Descrizione del modello piano utilizzato

Si riportano nel seguito le caratteristiche geometriche del modello utilizzato in STRAUS7 ed una serie di considerazioni qualitative utili per comprendere la filosofia che ha ispirato le scelte effettuate.

Con riferimento ai dati riportati in tabella si specifica che il modello è stato predisposto con riferimento alla linea d'asse degli elementi schematizzati. Le dimensioni indicate si riferiscono pertanto a suddette grandezze.

Nella tabella successiva, per le sezioni esaminate, sono fornite le principali caratteristiche geometriche e stratigrafiche utilizzate nelle verifiche.

| Sezione di calcolo | Sezione scatolare |

6.2.3. Descrizione del modello tridimensionale utilizzato

Si riportano nel seguito le caratteristiche geometriche del modello utilizzato in STRAUS7 ed una serie di considerazioni qualitative utili per comprendere la filosofia che ha ispirato le scelte effettuate.

Il modello è stato predisposto con riferimento al piano passante per l'asse degli elementi schematizzati.

Il modello rappresenta unicamente le strutture facenti parte dell'uscita di sicurezza .

6.2.4. Combinazioni di carico ed involuppi di riferimento

Come specificato in precedenza si sono considerati agenti tutti i carichi su un unico modello.

I carichi agenti considerati includono il peso proprio della struttura (tranne il peso proprio della soletta superiore considerato come detto in prima fase), ricoprimenti, ballast, le spinte del terreno in tensioni efficaci e la spinta dell'acqua in regime idrostatico per il livello di falda di progetto.

Inoltre si sono considerati agenti i carichi relativi ai convogli ferroviari sia in condizioni di esercizio (LM71, serpeggio, frenatura vento ecc.) che in casi eccezionali (deragliamento, sisma) e le azioni legato a ritiro, alle variazioni termiche costanti o ad un gradiente di temperatura.

Sono infine considerati i carichi tipici degli edifici quali relativi all'affollamento e alle scale.

I carichi applicati hanno il loro valore nominale di seguito riportato.

In sede di combinazione dei carichi e di involuppi si sono opportunamente coefficientati i vari carichi agenti attraverso i seguenti involuppi:

- Inviluppo in presenza di carichi variabili;
- inviluppo in presenza di carichi eccezionali;
- inviluppo in presenza di carichi per la fessurazione;
- inviluppo in presenza di carichi per il calcolo delle tensioni.

L'inviluppo in presenza di ciascuna di queste configurazioni prevede la presenza di differenti coefficienti di combinazione sia nei confronti dei carichi variabili sia per quanto riguarda i carichi permanenti (peso proprio, spinte del terreno e di carichi permanenti ed accidentali a tergo rilevato).

| | | |
|---|--|-------------------------|
| GENERAL CONTRACTOR  | ALTA SORVEGLIANZA  | |
| | IG51-02-E-CV-CL-GA1M-0X-002-A00 Relazione di calcolo uscite di sicurezza | Foglio 24 di 2636 |

L'inviluppo dei carichi variabili prevede la presenza nel modello finale dei carichi collegati all'esercizio ferroviario (LM71, centrifuga, serpeggio...) opportunamente coefficientati e raggruppati (vedi tabella 1.7.2.3 della norma "sovraccarichi per il calcolo dei ponti ferroviari") in maniera tale da considerare presenti contemporaneamente diversi carichi accidentali rendendo tuttavia carico principale di volta in volta una diversa azione rispetto alle altre (queste ultime valutate quindi presenti con carichi amplificati opportunamente ridotti).

L'inviluppo definito dei carichi eccezionali prevede la presenza nel modello finale dei carichi collegati al sisma o al deragliamento (in maniera esclusiva uno rispetto all'altro) visti come carichi principali ed alla contemporanea presenza dei carichi accidentali legati all'esercizio ferroviario visti come carichi secondari o terziari e coefficientati in maniera opportuna.

Anche i carichi permanenti del modello nelle due configurazioni fin qui descritte sono caratterizzati da differenti coefficienti a seconda di qual è il tipo di inviluppo considerato.

Discorso analogo si può effettuare per gli inviluppi definiti fessurazione e tensioni dove ancora una volta i coefficienti dei carichi permanenti agenti sono caratterizzati da coefficienti diversi rispetto ai precedenti tipi di inviluppo.

Ovviamente per quanto riguarda le sollecitazioni agenti sulla soletta superiore si sono sovrapposti questi risultati con quelli derivanti dall'analisi della trave in Fase I con schema appoggio – appoggio.

In particolare si sono sovrapposti gli effetti generati in fase I con quelli in esercizio dato che la struttura resistente è differente nelle due configurazioni considerate.

Di seguito si riporta una tabella che riporta per ciascun inviluppo relativo ad uno dei modelli i coefficienti moltiplicativi utilizzati per le singole condizioni di carico elementari sia nel caso in cui esse agiscano a favore di sicurezza sia nel caso in cui agiscano a sfavore di sicurezza. Ci si riferisce ad un caso generale. Qualora alcune delle condizioni elementari riportate negli inviluppi non fosse presente nel modello analizzato essa viene posta pari a 0 nel modello stesso e non sortisce quindi alcun effetto a livello di inviluppo.

| | IG51-02-E-CV-CL-GA1M-0X-002-A00 Relazione di calcolo uscite di sicurezza | Foglio 28 di 2636 |

Nella tabella si può notare come siano riportate anche delle sigle che identificano il set ed il gruppo a cui appartengono determinati carichi mentre altri sono caratterizzati dalla sigla “none”.

I set (ad esempio “spinta terreno falda alta” o “spinta terreno falda bassa”) raggruppano alcune condizioni di carico; alle condizioni che vi fanno parte può essere abbinato il comando “and” oppure quello “or”; la sigla “and” sta a significare che le sollecitazioni dovute alle singole condizioni appartenenti a quel set si sommano sempre tra loro (opportunamente coefficientate), la scritta “or” indica che solo la peggiore tra le condizioni raggruppate per quel determinato involuppo viene presa in considerazione.

Il gruppo (ad esempio “grp C”) raccoglie almeno 2 set ed indica che i set ad esso appartenenti sono considerati come un’entità a se stante e dunque le sollecitazioni (massime o minime a seconda del tipo di involuppo considerato) generate vanno a sovrapporsi a quelle caratterizzate dalla sigla “none” che non appartengono ad alcun set o gruppo; queste ultime sono sempre presenti con il loro valore massimo o minimo (in considerazione del tipo di involuppo che l’utente vuole andare ad analizzare).

Da ciascun gruppo viene estrapolato il valore (massimo o minimo) legato ad uno ed un solo set, quello di volta in volta più gravoso.

Di seguito si riportano i set ed i gruppi utilizzati nei vari modelli con la tipologia di “comportamento” ad essi associata.

Tabella 13 – Set e gruppi di carico utilizzati per la definizione delle combinazioni di carico

Questi set e gruppi sono riscontrabili anche nei file di input riportati all'interno degli allegati numerici.

6.2.5. Determinazione delle sollecitazioni di verifica

Il modello descritto è stato utilizzato per la validazione delle carpenteria, la determinazione dell'armatura e delle incidenze relative a ciascun elemento strutturale.

Il modello bidimensionale e il modello tridimensionale adottati per determinare le sollecitazioni sulla struttura sono stati caricati con tutte le azioni permanenti accidentali ed eccezionali previsti dalle normative con l'obiettivo di determinare gli involuppi delle sollecitazioni agenti su questo tipo di struttura.

Si sono quindi determinati gli involuppi per le condizioni legate alla presenza dei carichi variabili come predominanti, successivamente per la presenza dei carichi eccezionali ed infine per i carichi legati alla fessurazione ed alle verifiche tensionali.

Ovviamente per ciascuna tipologia di involuppo si è valutato il valore massimo e minimo in termini di segno; gli involuppi risultano quindi essere complessivamente 8 per ciascun modello.

Di seguito si riportano le singole condizioni di carico elementari considerate nei vari modelli utilizzati, per semplicità di rappresentazione si riportano solamente quelli relativi al modello bidimensionale.

6.3. Condizioni di carico analizzate

Di seguito vengono riportate le analisi dei carichi descrivendone la tipologia e la zona di applicazione.

Per avere maggiori dettagli specifici si rimanda agli allegati numerici di input che sono riportati integralmente.

| | Foglio 30 di 2636 |

1. Peso proprio (Condizione di carico 1)

Peso proprio struttura:

$$\gamma = 2500 \text{ daN/m}^3$$

Il peso proprio è stato considerato mediante l'applicazione dell'accelerazione di gravità ai beam dei piedritti e della soletta inferiore costituenti il modello mentre il peso proprio della soletta superiore (fase I) è stato applicato come carico concentrato sui piedritti.

Il valore del peso proprio della soletta applicato in testa a ciascun piedritto risulta pari a:

$$P_{soletta} = \frac{q \cdot L \cdot s_{soletta}}{2} = \frac{2500 \cdot 12.8 \cdot 1.20}{2} = 192 \text{ kN} / m$$

Figura 11 – Peso proprio

2. Spinta terreno SX K0 falda alta e Spinta terreno DX K0 falda alta (Condizioni di carico 45 e 46)

Sono state applicate le spinte del terreno in presenza della falda alla massima quota di progetto (157.03 m s.m.m.). Tale altezza di falda è stata scelta poiché la più sfavorevole per lo scatolare.

Tali spinte saranno caratterizzate da un coefficiente relativo al peso specifico del terreno pari al suo valore nominale sopra la quota della falda mentre sarà espresso in tensioni efficaci al di sotto di tale quota.

Per i valori caratteristici di ciascun strato (spessori, peso specifico terreno, angolo di attrito interno e relativi valori di coefficienti di spinta) si rimanda alla tabella seguente.

| | |
|--|--|
| GENERAL CONTRACTOR  Consorzio Collegamenti Integrati Veloci | ALTA SORVEGLIANZA  GRUPPO FERROVIE DELLO STATO ITALIANE |
| | IG51-02-E-CV-CL-GA1M-0X-002-A00 Relazione di calcolo uscite di sicurezza |
| | Foglio 31 di 2636 |

Il valore della spinta è stato calcolato considerando il coefficiente di spinta a riposo K_0 assumendo un monostrato costituito dal materiale di riempimento dello scavo.

Nella valutazione delle spinte delle terre, a favore di sicurezza, si è considerato che l'angolo di attrito tra paramento verticale e terreno sia pari a zero.

Nelle verifiche geotecniche si farà riferimento a spinte delle terre determinabili con la seguente equazione:

$$p'_a(z) = \sigma'_{v(z)} \cdot K_0$$

- $\sigma'_{v(z)}$ = tensione verticale efficace alla generica quota z ;
- K_0 = coefficiente di spinta a riposo;
- q = eventuale sovraccarico uniformemente distribuito.

Il calcolo di K_0 avviene utilizzando la formula di Jaky, valida per superfici di rottura piane, riportata di seguito:

$$K_0 = 1 - \tan \phi$$

con:

ϕ = angolo di resistenza al taglio.

Per ogni strato di materiale a tergo si sono calcolate le spinte esercitate con la precedente formulazione.

Nella valutazione delle spinte, vista la modalità di realizzazione dell'opera si è tenuto conto di una stratigrafia omogenea frutto del terreno di ritombamento. I parametri di riferimento sono quelli riportati in tabella.

| γ (kN/m^3) | c' (kPa) | ϕ' ($^\circ$) |
|---------------------------------|--------------------------|-------------------------|
| 20 | 0 | 35 |

Tabella 14 – Parametri del terreno

Nel seguito si riportano le sollecitazioni statiche oggetto delle verifiche. La profondità è riferita allo 0 coincidente con il nodo posto alla base del piedritto del modello.

1. Lo 0 coincide con il nodo posto alla base del piedritto del modello

Tabella 15 – Spinta terreno DX K_0 falda alta (Condizione 46)

Figura 12 – Spinta terreno DX K0 falda alta (Condizione 46)

La spinta sul lato sinistro risulta essere simmetrica.

Figura 13 – Spinta terreno SX K0 falda alta (Condizione 45)

3. Spinta idraulica falda alta (Condizione di carico 4)

Si è considerata la spinta agente sui piedritti dovuta alla pressione dell'acqua nell'ipotesi di falda alta stimata ad una quota assoluta di +157.03 m s.m.m. che corrisponde a circa 8.5 m da quota asse platea.

La pressione massima risulta pari 85 kN/m.

Per la descrizione delle sottospinte sulla soletta inferiore in corrispondenza della falda alta si veda di seguito la condizioni 31.

Figura 14 – Spinta idrostatica falda alta (Condizione 4)

| | Foglio 34 di 2636 |

4. Spinta sinistra accidentale K0 (Condizione 21)

Si tratta della spinta sui piedritti dovuta al carico accidentale stradale

Si è assunto un carico verticale per unità di superficie pari a:

$$Q_{acc} = 10.00 \text{ kN/mq}$$

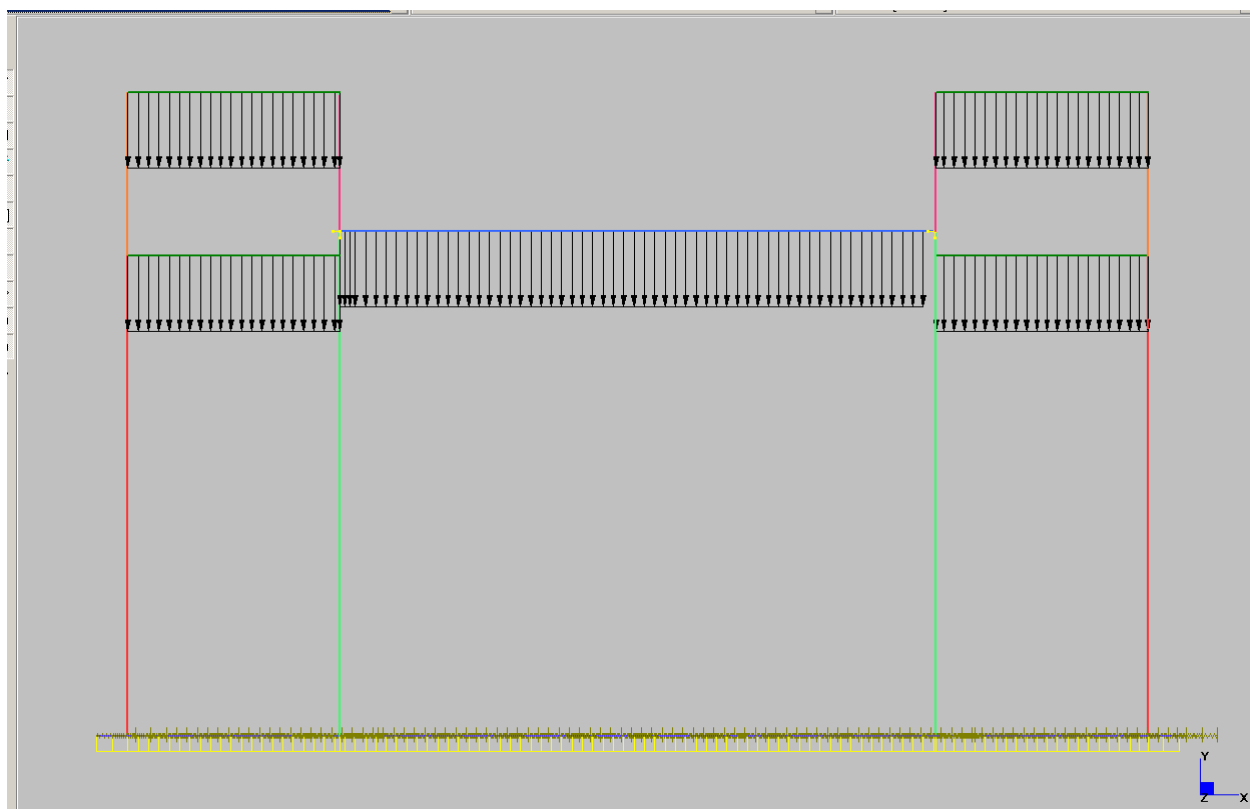

Figura 15 – Carico accidentale (Condizione 50)

Tale carico risulta simmetrico anche nell'altra direzione, tuttavia non è stata implementata la condizione di carico poiché lo scatolare è stato dimensionato simmetricamente.

5. Spinta sinistra accidentale K0 (Condizione 50)

Si tratta della spinta sui piedritti dovuta al carico accidentale stradale

Si è assunto un carico verticale per unità di superficie pari a:

$$Q_{acc} = 10.00 \text{ kN/mq}$$

Tale valore deve essere moltiplicato per il coefficiente di spinta a riposo K0 opportuno ($K0 = 0.426$).

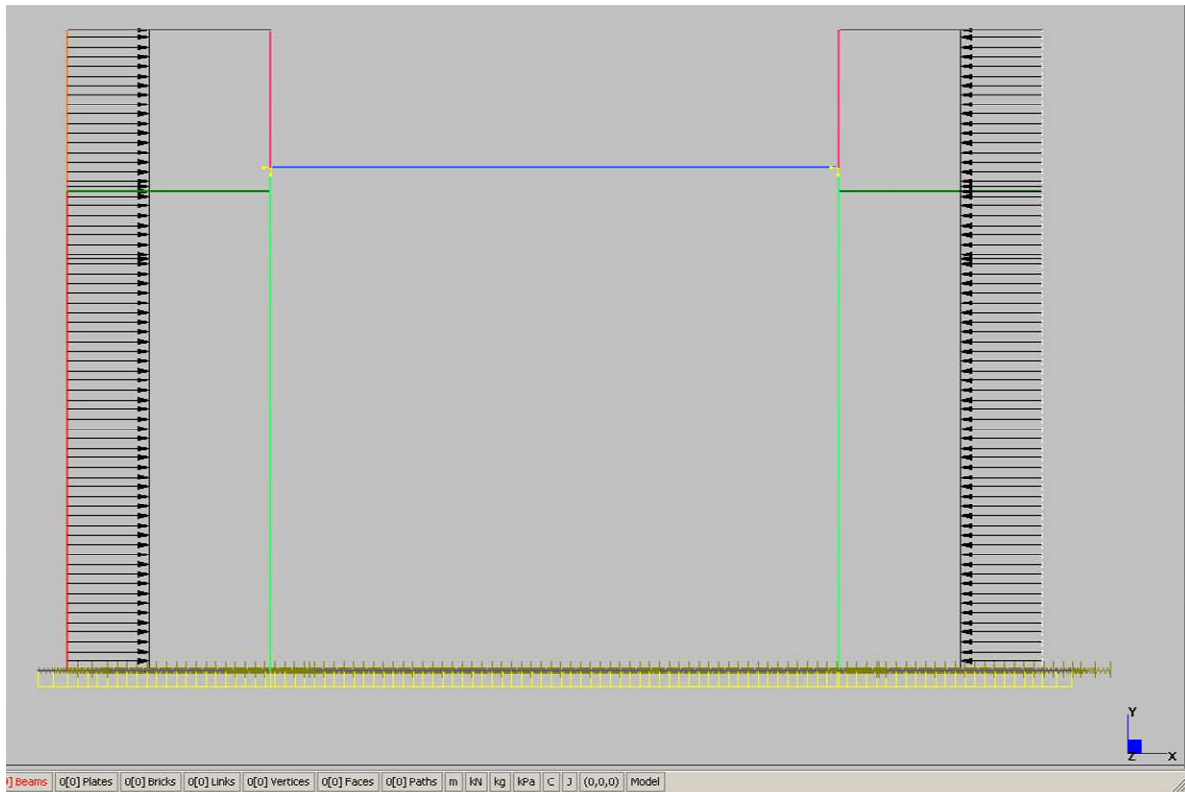

Figura 16 – Spinta sinistra accidentale K_0 (Condizione 50)

Tale carico risulta simmetrico anche nell'altra direzione, tuttavia non è stata implementata la condizione di carico poiché lo scatolare è stato dimensionato simmetricamente.

6. Ricoprimento (Condizione 10)

Si è valutato il peso del ricoprimento di terreno posto all'interfaccia superiore della soletta.

$$\gamma_{\text{ricoprimento}} = 20 \text{ kN/m}^3$$

Lo spessore massimo del ricoprimento per la sezione è pari a 2.48 m.

$$Q_{\text{ricopr}} = \gamma_{\text{ricopr}} \cdot s_{\text{ricopr}} = 2000 \cdot 2.48 = 49.70 \text{ kN/m}^2$$

Questo carico è stato applicato sulla soletta superiore per tenere conto del ricoprimento ivi presente.

| | | |
|---|--|-------------------------|
| GENERAL CONTRACTOR  | ALTA SORVEGLIANZA  | |
| | IG51-02-E-CV-CL-GA1M-0X-002-A00 Relazione di calcolo uscite di sicurezza | Foglio 36 di 2636 |

Figura 17 – Ricoprimento (Condizione 10)

Mentre lo spessore massimo del ricoprimento per la sezione di copertura è pari a 0.3475 m.

$$Q_{ricopr} = \gamma_{ricopr} \cdot S_{ricopr} = 2000 \cdot 0.347 = 6.95 \text{ kN/m}^2$$

Questo carico è stato applicato sulla soletta superiore per tenere conto del ricoprimento ivi presente.

7. Incremento spinta terreno sismica DX (Condizione 12) associata alla Spinta terreno SX falda alta e falda bassa(Condizioni 2 e 5)

Questa condizione di carico prevede l'applicazione di una spinta da sinistra verso destra a tergo dei piedritti di risultante pari alla differenza tra la spinta totale sismica dovuta al terreno agente in regime di tensioni totali e la spinta totale in condizioni statiche calcolata in regime spinta attiva.

L'applicazione di questo carico è prevista mediante una distribuzione triangolare rovesciata (entità massima in sommità, valore nullo al lembo inferiore del montante).

Questa condizione di carico è associata alla presenza del sisma all'interno dell'involuppo "Eccezionali" nel gruppo C che comprende i set "SISMA UNO" e "SISMA DUE".

Tale forza può agire solo verso destra.

L'azione di questa condizione è alternativa a quello della condizione successiva riferita alla spinta sismica DX (Condizione 13).

Nel dettaglio l'incremento di spinta a tergo della paratia è stimato pari a $\Delta F = F_s - F$, dove:

F rappresenta la spinta esercitata dal terreno in condizioni statiche, calcolata come integrale, sull'altezza di scavo, della tensione orizzontale esercitata dal terreno in condizioni di equilibrio limite attivo e fornita dall'espressione:

$$- \sigma_h = K_a \sigma_{v0} - 2 c (K_a)^{0.5}$$

F_s rappresenta la spinta esercitata dal terreno in condizioni sismiche, calcolata come integrale, sull'altezza di scavo, della tensione orizzontale esercitata dal terreno in condizioni sismiche, trascurando l'attrito terreno struttura, e fornita dall'espressione:

$$- \sigma_{hs} = K_{as} \sigma_{v0} - 2 c (K_{as})^{0.5}$$

Nelle due espressioni i simboli rappresentano:

- $\sigma_{v0} = \gamma z$ = tensione verticale
- c = coesione
- K_a, K_{as} = rispettivamente coefficiente di spinta attiva in condizioni statiche (calcolato con il metodo di Coulomb) e sismico (calcolato con il metodo di Mononobe-Okabe) trascurando l'attrito all'interfaccia tra terreno e struttura.

Nelle verifiche effettuate, l'incremento di spinta ΔF così calcolato è applicato a tergo della paratia come una pressione orizzontale con andamento triangolare sull'altezza libera della paratia, in modo da ottenere una risultante posta a 2/3 dell'altezza libera dal fondo dello scavo, così come indicato nello schema che segue.

Nel seguito si riportano le sollecitazioni statiche e sismiche oggetto delle verifiche. La profondità è riferita allo 0 coincidente con il nodo alla base del piedritto del modello. Come già evidenziato prima nella condizione di falda alta la falda si trova a 9.1m dal nodo posto a 0 ed assente nella condizione di falda bassa.

| Incremento spinta terreno sismica DX associata alla Spinta terreno SX falda bassa (Condizione 2) | | | | | | | | |
|--|---------------------|--------------------------------|----------|-------------|---------------------|--------------------|----------------------|-----------------------------|
| z (m) | Terreno | \square (kN/m ³) | c' (kPa) | ϕ' (°) | K _{as} (-) | K _a (-) | σ_{ha}' (kPa) | $\Delta\sigma_{has}'$ (kPa) |

| | Foglio 39 di 2636 |

analisi delle combinazioni di carico eccezionali alternativamente alla spinta attiva statica SX con falda alta (Condizione 2) e spinta attiva statica SX con falda bassa (Condizione 5).

8. Inerzia sismica orizzontale (Condizione 14)

Forza d'inerzia orizzontale $F_i = C W$ dove:

C = coefficiente d'intensità sismica pari a 0,04 per zone sismiche di II° categoria (grado di sismicità $S = 6$)

W = peso proprio della paratia

Tale forza viene applicata, nelle verifiche effettuate, come una pressione orizzontale con distribuzione rettangolare, su tutta l'altezza dell'elemento strutturale, in modo che la risultante sia posta nel baricentro dei pesi.

Essa tiene conto dei seguenti parametri:

$$S = 6$$

$$C = (s-2)/100 = 0.04$$

$$R = 1.0$$

$$\varepsilon = 1.0$$

$$B = 1.0$$

$$I = 1.0$$

Per cui il coefficiente moltiplicativo dei carichi verticali utilizzato per il calcolo delle forze inerziali sismiche è pari a:

$$F_h = C \cdot R \cdot \varepsilon \cdot B \cdot I = 0.04$$

I pesi permanenti sono pari a:

Soletta superiore

$$Q_{pp} = 2500 \cdot 1.2 = 30 \text{ kN/m}^2$$

Soletta inferiore

$$Q_{pp} = 2500 \cdot 1.4 = 35 \text{ kN/m}^2$$

Piedritti esterni

$$Q_{pp} = 2500 \cdot 0.9 = 22.5 \text{ kN/m}^2$$

Piedritti interni

$$Q_{pp} = 2500 \cdot 0.5 = 12.5 \text{ kN/m}^2$$

Il **carico permanente** sulla soletta superiore è pari a:

$$Q_{perm} = 20 \cdot 3.00 = 60 \text{ kN/m}^2$$

$$Q_{perm \text{ soletta inferiore}} = 14.4 \text{ kN/m} + 14 \text{ kN/m} = 28.4 \text{ kN/m}^2$$

Il **carico totale permanente**:

$$Q_{tot \text{ perm soletta superiore}} = 30 + 60 = 90 \text{ kN/m}^2$$

$$Q_{tot \text{ perm soletta inferiore}} = 35 + 28.4 = 63.4 \text{ kN/m}^2$$

Le **forze inerziali** sulle solette e sui piedritti sono dunque pari rispettivamente a:

$$F_h \text{ soletta soletta superiore} = 0.04 \cdot 90 = 3.6 \text{ kN/m}^2$$

$$F_h \text{ soletta soletta inferiore} = 0.04 \cdot 63.4 = 2.536 \text{ kN/m}^2$$

$$F_h \text{ piedritti} = 0.04 \cdot 22.5 = 0.9 \text{ kN/m}^2$$

La forza di inerzia sismica orizzontale dovuta agli accidentali viene determinata considerando un carico accidentale opportuno secondo quanto previsto dalla norma 44b.

Si considera la situazione più gravosa caratterizzata dalla presenza di 2 carichi Q distanti tra loro 1,50 m di intensità pari a 200 kN.

$$Q = 20 \text{ kN}$$

Il coefficiente s è pari a:

$$s = 1 + 0.5 \cdot (n-1)$$

con n = numero binari = 2

$$s = 1 + 0.5 \cdot (2-1) = 1.5$$

Il carico per unità di superficie risulta quindi pari a:

$$q = s \cdot n \cdot Q / (b_{tras} \cdot B_{long} \cdot n) = 15.385 \text{ kN/m.}$$

La forza inerziale orizzontale per la presenza dell'accidentale è dunque pari in definitiva a:

$$q_{sism} = s \cdot n \cdot Q / (b_{tras} \cdot B_{long} \cdot n) \cdot 0.04 = 0.6154 \text{ kN/m.}$$

Questa condizione di carico è associata alla presenza del sisma all'interno dell'involuppo "Eccezionali" nel gruppo C che comprende i set "SISMA UNO" e "SISMA DUE".

Questi carichi sono stati applicati sul modello in maniera uniforme sulla soletta superiore, sui piedritti, sulla soletta inferiore con diverse intensità a seconda dei carichi permanenti ed accidentali che generano la massa sismica da considerare seconda la normativa specifica.

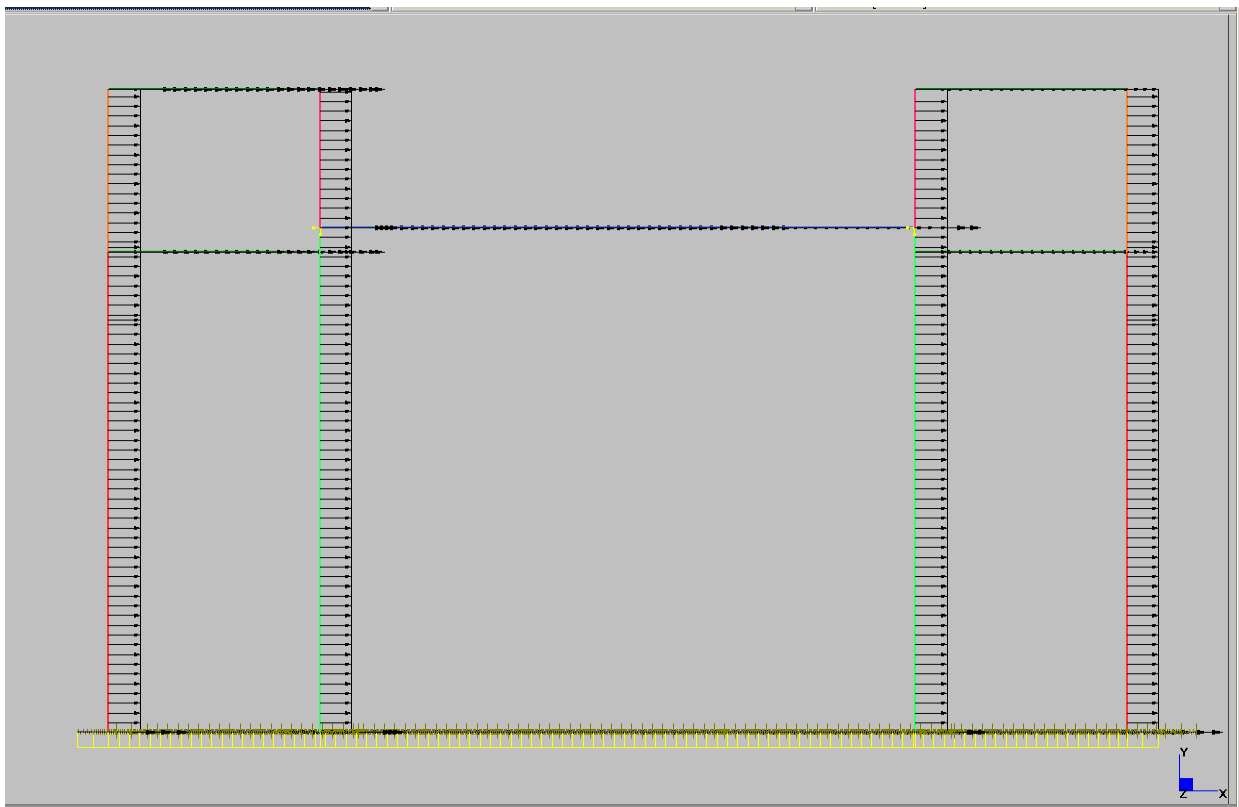

Figura 19 – Inerzia sismica orizzontale (Condizione 14)

| | |
|--|--|
| GENERAL CONTRACTOR  Consorzio Collegamenti Integrati Veloci | ALTA SORVEGLIANZA  GRUPPO FERROVIE DELLO STATO ITALIANE |
| | IG51-02-E-CV-CL-GA1M-0X-002-A00 Relazione di calcolo uscite di sicurezza |
| | Foglio 41 di 2636 |

9. Inerzia sismica verticale (Condizione 15)

Forza d'inerzia orizzontale $F_i = C W$ dove:

C = coefficiente d'intensità sismica pari a 0,04 per zone sismiche di II° categoria (grado di sismicità $S = 6$)

W = peso proprio della paratia

Tale forza viene applicata, nelle verifiche effettuate, come una pressione orizzontale con distribuzione rettangolare, su tutta l'altezza dell'elemento strutturale, in modo che la risultante sia posta nel baricentro dei pesi.

Essa tiene conto dei seguenti parametri:

$$S = 6$$

$$C = (s-2)/100 = 0.04$$

$$R = 1.0$$

$$\varepsilon = 1.0$$

$$B = 1.0$$

$$I = 1.0$$

Per cui il coefficiente moltiplicativo dei carichi verticali utilizzato per il calcolo delle forze inerziali sismiche è pari a:

$$F_v = C \cdot R \cdot \varepsilon \cdot B \cdot I = 0.04$$

I pesi permanenti sono pari a:

Soletta superiore

$$Q_{pp} = 2500 \cdot 1.2 = 30 \text{ kN/m}^2$$

Soletta inferiore

$$Q_{pp} = 2500 \cdot 1.4 = 35 \text{ kN/m}^2$$

Piedritti esterni

$$Q_{pp} = 2500 \cdot 0.9 = 22.5 \text{ kN/m}^2$$

Piedritti interni

$$Q_{pp} = 2500 \cdot 0.5 = 12.5 \text{ kN/m}^2$$

Il **carico permanente** sulla soletta superiore è pari a:

$$Q_{perm} = 20 \cdot 3.00 = 60 \text{ kN/m}^2$$

$$Q_{perm \text{ soletta inferiore}} = 14.4 \text{ kN/m} + 14 \text{ kN/m} = 28.4 \text{ kN/m}^2$$

Il **carico totale permanente**:

$$Q_{tot \text{ perm soletta superiore}} = 30 + 60 = 90 \text{ kN/m}^2$$

$$Q_{tot \text{ perm soletta inferiore}} = 35 + 28.4 = 63.4 \text{ kN/m}^2$$

Le **forze inerziali** sulle solette e sui piedritti sono dunque pari rispettivamente a:

$$F_h \text{ soletta soletta superiore} = 2 \cdot 0.04 \cdot 90 = 7.2 \text{ kN/m}^2$$

$$F_h \text{ soletta soletta inferiore} = 2 \cdot 0.04 \cdot 63.4 = 5.072 \text{ kN/m}^2$$

$$F_h \text{ piedritti} = 2 \cdot 0.04 \cdot 22.5 = 1.8 \text{ kN/m}^2$$

La forza di inerzia sismica orizzontale dovuta agli accidentali viene determinata considerando un carico accidentale opportuno secondo quanto previsto dalla norma 44b.

Si considera la situazione più gravosa caratterizzata dalla presenza di 2 carichi Q distanti tra loro 1,50 m di intensità pari a 200 kN.

$$Q = 20 \text{ kN}$$

Il coefficiente s è pari a:

$$s = 1 + 0.5 \cdot (n-1)$$

con $n = \text{numero binari} = 2$

$$s = 1 + 0.5 \cdot (2-1) = 1.5$$

Il carico per unità di superficie risulta quindi pari a:

$$q = s \cdot n \cdot Q / (b_{\text{tras}} \cdot B_{\text{long}} \cdot n) = 15.385 \text{ kN/m.}$$

La forza inerziale orizzontale per la presenza dell'accidentale è dunque pari in definitiva a:

$$q_{\text{sism}} = s \cdot n \cdot Q / (b_{\text{tras}} \cdot B_{\text{long}} \cdot n) \cdot 0.04 \cdot 2 = 1.2308 \text{ kN/m.}$$

Questa condizione di carico è associata alla presenza del sisma all'interno dell'involuppo "Eccezionali" nel gruppo C che comprende i set "SISMA UNO" e "SISMA DUE".

Questi carichi sono stati applicati sul modello in maniera uniforme sulla soletta superiore, sui piedritti, sulla soletta inferiore con diverse intensità a seconda dei carichi permanenti ed accidentali che generano la massa sismica da considerare seconda la normativa specifica.

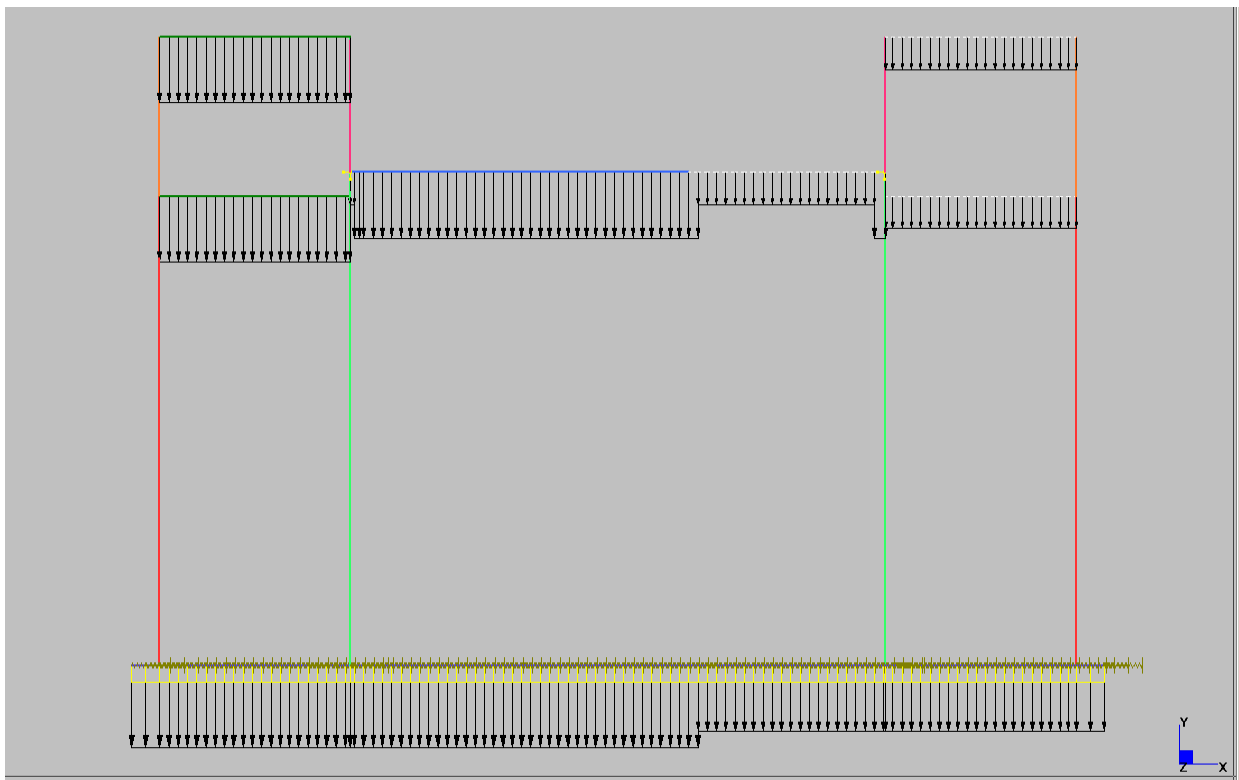

Figura 20 – Inerzia sismica verticale DX (Condizione 14a)

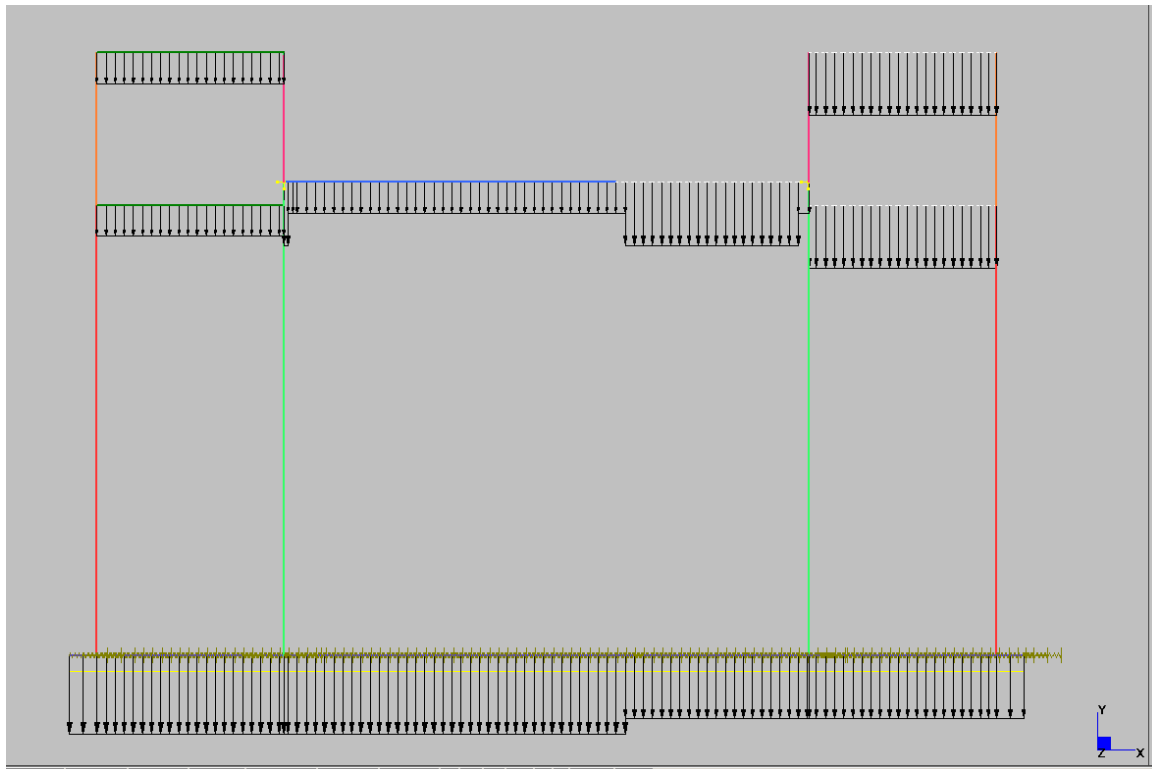

Figura 21 – Inerzia sismica verticale SX (Condizione 14a)

10. LM71- 2: Carichi variabili ferroviari con incremento dinamico su due binari (Condizione 36)

Carico distribuito uniformemente su di una striscia di scatolare di profondità unitaria, dovuto al transito di un treno, con percorrenza ortogonale rispetto all'asse dello scatolare.

Il carico ferroviario dovuto ad un treno tipo LM71 con gli assali in mezzzeria è pari a:

$$Q_{vk} = 1,1 \cdot 250 = 275 \text{ kN}$$

Essendo $\alpha = 1.1$ il coefficiente di adattamento

Supponendo una diffusione del carico pari a 1:4 nel ballast e di 1:1 nella soletta, la larghezza di ripartizione longitudinale del carico di un treno sulla soletta risulta:

$$B_{tras} = 2.6 + ((1.2)/4 + 0.7/2) \cdot 2 = 3.9 \text{ m}$$

Per il calcolo del coefficiente di incremento dinamico ϕ_3 è stata fatta l'ipotesi a favore di sicurezza di un basso standard manutentivo, ipotesi a favore di sicurezza.

La valutazione del coefficiente dinamico è stata effettuata considerando le lunghezze di calcolo delle solette e la lunghezza dei piedritti incastrati alla base.

A favore di sicurezza nella valutazione della lunghezza dei piedritti si considera la lunghezza dalla posizione di incastro e non la luce effettiva utilizzata nel modello

$$L_{\phi} = k \cdot L_m$$

$$L_m = 1/n \cdot (L_1 + L_2 + L_3 \dots + L_n)$$

La formula per il calcolo di ϕ_3 :

$$\phi_3 = 2.16 / ((L_{\phi})^{0.5} - 0.2) + 0.73 \text{ con la limitazione } 1.0 < \phi_3 < 2.0$$

| | |
|--|--|
| GENERAL CONTRACTOR  Consorzio Collegamenti Integrati Veloci | ALTA SORVEGLIANZA  GRUPPO FERROVIE DELLO STATO ITALIANE |
| | IG51-02-E-CV-CL-GA1M-0X-002-A00 Relazione di calcolo uscite di sicurezza |
| | Foglio 44 di 2636 |

Quindi per la sezione analizzata tali quantità risultano essere pari a:

$$L_m = (10.1 + 11.9 + 10.1) \cdot 1/3 = 10.7 \text{ m}$$

$$L_\phi = 1.3 \times 10.7 = 13.91 \text{ m}$$

$$\phi_3 = 1.342$$

Il carico per unità di superficie, tenuto conto dei 4 carichi di intensità pari a 250 kN ciascuno ad interasse 1,60 m (6,40 m il tratto totale) risulta dunque pari a:

$$q = 4 \times 250 \times 1.1 \times 1.342 / (3.9 \times 6.4) = 59.14 \text{ kN/m}^2.$$

Tale carico si estende trasversalmente su un tratto di 3.9 m e longitudinalmente su un tratto di 1,0m (analisi a metro di profondità).

Di seguito si riporta la modalità di applicazione sul modello di calcolo.

Figura 22 – LM71 – 2 sotto (Condizione 36)

11. Serpeggio (Condizione 19 e 37)

Tale azione prevede un carico pari a:

$$Q_{sk} = 100 \text{ kN}$$

applicato alla sommità della rotaia più alta.

Di conseguenza si avrà un momento flettente trasversale sulla soletta pari a:

$$M = 100 \cdot (H/2 + P.F.) = 100 \cdot (1.2 + 1.4/2 + 0.4) = 230 \text{ kN}\cdot\text{m}$$

essendo P.F. la distanza dal piano del ferro al lembo superiore della soletta.

La forza ed il momento sollecitanti sono stati applicati in maniera diffusa sui nodi della soletta di base per un tratto di lunghezza pari alla campata stessa.

| | |
|--|--|
| GENERAL CONTRACTOR  Consorzio Collegamenti Integrati Veloci | ALTA SORVEGLIANZA  GRUPPO FERROVIE DELLO STATO ITALIANE |
| | IG51-02-E-CV-CL-GA1M-0X-002-A00 Relazione di calcolo uscite di sicurezza |
| | Foglio 45 di 2636 |

Questo carico è abbinato eventualmente (se peggiorativo) alla presenza del treno sulla stessa campata.

Figura 23 – Serpeggio (Condizione 37)

12. Centrifuga (Condizione 38)

Il valore caratteristico della forza centrifuga sarà pari a:

$$q_{tk} = V_2 / (127 \cdot r) \cdot (f \cdot q_{vk})$$

con:

V = velocità di progetto espressa in km/h = 250

f = fattore di riduzione pari nella fattispecie a 1,0

r = raggio di curvatura in metri = 3500m

q_{vk} = valore caratteristico dei carichi verticali = $250 / (3.9 \times 1.60) = 40.064 \text{ daN/m}^2$.

$q_{tk} = 5.633 \text{ kN/m}$

Tale forza è applicata ad una quota di 1,80 m dal piano ferro.

Essa genera dunque un momento flettente di intensità pari a:

$$M = 5.633 \times (1.80 + 1.6 + 1.4/2) = 23.1 \text{ kNm/m}$$

La forza ed il momento sollecitanti sono stati applicati in maniera diffusa sui nodi della soletta di base (riferiti alla linea A.V.) per un tratto di lunghezza pari a 3.9 m per corsia di percorrenza, coincidenti con il tratto di azione del treno LM71 corrispondente e non sono stati amplificati del coefficiente dinamico così come previsto dalla norma.

| GENERAL CONTRACTOR  | ALTA SORVEGLIANZA  | |
| | IG51-02-E-CV-CL-GA1M-0X-002-A00 Relazione di calcolo uscite di sicurezza | Foglio 46 di 2636 |

Figura 24 –Centrifuga (Condizione 38)

13. Deragliamento (Condizioni 41, 42, 43 e 44)

Il carico relativo al deragliamento prevede 2 possibili carichi:

il primo (relativo alle condizioni 41 e 42) prevede l'applicazione del carico q_{A1d} costituito da 2 forze di intensità pari a 50 kN/m (comprensivi dell'effetto dinamico).

Tali carichi sono applicati nel caso più eccentrico possibile uno in corrispondenza della rotaia esterna e l'altro ad una distanza dal baricentro dei binari pari a 1.5 volte lo scartamento e comunque non ad una distanza superiore di s rispetto al primo carico.

Alternativamente essi possono essere posizionati uno all'interno dei binari in posizione generica e l'altro ad una distanza massima pari a s (scartamento).

Il secondo (condizioni 43 e 44) prevede l'applicazione di un unico carico pari a 80 kN/m disposto trasversalmente con un'eccentricità massima, lato esterno di 1.5 volte lo scartamento.

Nelle varie sezioni analizzate si sono quindi considerati in maniera opportuna agenti i carichi indicati.

Essi appartengono al gruppo C (carichi eccezionali) e ad un set che prevede l'esclusività di ciascun carico rispetto agli altri (infatti al più uno ed un solo carico relativo al deragliamento può essere considerato agente).

La presenza del carico relativo al deragliamento appartenendo al gruppo degli eccezionali esclude quella del sisma (forze inerziali sismiche, spinte del terreno, treno sismico ecc.).

Entrambi le tipologie di carico nella sezione analizzata (Condizione 41, 42, 43 44) sono state considerate agenti alternativamente sulla soletta di base applicato ad un'area di 0.40 m in 2 distinte posizioni per un totale di 4 condizioni elementari tra le quali, nelle fasi di involuppo delle sollecitazioni verrà individuata la peggiore punto per punto all'interno dell'involuppo dei carichi "eccezionali".

Figura 25 – Deragliamento qA1d (Condizione 41)

Figura 26 – Deragliamento qA1d (Condizione 42)

Figura 27 – Deragliamento qA2d (Condizione 43)

Figura 28 – Deragliamento qA2d (Condizione 44)

14. Gradiente termico (Condizione 26)

Si è considerata una variazione termica uniforme tra estradosso ed intradosso della soletta superiore di +/- 2.5 °C che da origine ad un gradiente pari a:

$$GT = 5/1.20 = 4.167 \text{ °C/m}$$

tenendo conto del modulo elastico istantaneo.

Figura 29 – Gradiente termico (Condizione 26)

15. Variazione termica costante (Condizione 27)

Variazione termica sulla soletta superiore pari a $\pm 15^{\circ}\text{C}$ e modulo elastico di riferimento pari a $1/3$ di quello istantaneo, equivalente quindi a $\pm 5^{\circ}\text{C}$.

Figura 30 – Variazione termica costante (Condizione 27)

16. Ritiro (Condizione 28)

Il ritiro della soletta è stato considerato come una variazione termica uniforme, negativa, derivante dalla diminuzione di volume della soletta:

Considerando da normativa, un ambiente con umidità 55%. $\alpha > 60$ cm, $t_0 > 60$ gg, si ottiene:

- $\varepsilon_{rit} = 0.28/1000$
- $\sigma_{rit} = \varepsilon_{rit} \cdot E_c^*$
- $\sigma_{rit} = E_c \cdot \alpha T \cdot \Delta T$
- $\alpha T = 0.00001$ = coeff. di dilatazione termica del calcestruzzo
- $E_c^*/E_c = 0.333$

Dall'uguaglianza tra σ_{rit} e σ_{rit} ne deriva :

$$\Delta T = \varepsilon_{rit} \cdot E_c^* / (E_c \cdot \alpha T) = 10^\circ\text{C} \text{ (diminuzione di temperatura)}$$

Figura 31 – Ritiro (Condizione 28)

| | Foglio 52 di 2636 |

17. Sottospinta falda alta (Condizione 31)

Si applica alla soletta inferiore un carico uniforme rivolto verso l'alto di intensità pari alla pressione generata dal battente idrico.

Questo carico è associato nelle analisi di combinazione ed involuppo sempre alla corrispondente spinta idraulica laterale ed alle spinte del terreno nelle medesime condizioni con i coefficienti favorevoli e sfavorevoli previsti nei vari involuppi a seconda che l'azione agisca a favore o a sfavore di sicurezza.

La sottospinta agente su tutta la soletta inferiore ha un'intensità pari a 86 kN/m con una forza concentrata in corrispondenza dei piedritti pari al carico lineare per il semispessore $N = 86 \cdot 0.9/2 = 38.7 \text{ kN}$

Figura 32 – Sottospinta falda alta (Condizione 31)

18. Folla (Condizione 40)

Si considera un carico variabile di intensità pari a 10 kN/m^2 per tenere conto dell'eventuale presenza della folla sui marciapiedi a bordo dei binari qualora presenti.

Tale carico si estende su un tratto di 100 cm alle estremità dei binari.

Come previsto dalla norma tale carico non viene considerato contemporaneamente al passaggio dei treni e non viene amplificato per il coefficiente dinamico ϕ .

19. Ballast (Condizione 33)

Si considera un'altezza di 80cm e un peso specifico del materiale pari a 18 kN/m^3 . Ne risulta una pressione distribuita applicata alla soletta di base pari a:

$$p = 18 \cdot 0.8 = 14.4 \text{ kN/m}$$

Figura 34 – Ballast (Condizione 33)

| | Foglio 55 di 2636 |

20. Ricoprimento inferiore (Condizione 34)

Nella zona centrale si considera un'altezza di 70cm e un peso specifico del materiale pari a 20 kN/m^3 , nelle due zone laterali si considera un'altezza di 180cm e un peso specifico del materiale pari a 24 kN/m^3 . Ne risulta una pressione distribuita applicata alla soletta di base pari a:

$$p_c = 20 \cdot 0.7 = 14.00 \text{ kN/m}$$

$$p_l = 24 \cdot 1.8 = 43.20 \text{ kN/m}$$

Figura 35 – Ricoprimento (Condizione 34)

21. Marciapiedi (Condizione 35)

Si considera un'altezza di 40cm, una base di 1.2m e un peso specifico del materiale calcestruzzo pari a 25 kN/m^3 . Ne risulta una pressione distribuita applicata alla soletta di base pari a:

$$p = 25 \cdot 0.4 \cdot 1.2 = 12 \text{ kN/m}$$

Figura 36 – Marciapiede (Condizione 35)

22. Condizioni per il modello tridimensionale

| | Foglio 60 di 2636 |

6.4. Combinazioni di carico e criteri di verifica

Per ciascun elemento strutturale e per ciascuna sezione di verifica vengono riportate combinazioni e le verifiche previste dalla normativa.

Vengono utilizzate le combinazioni delle azioni previste dall'Istruzione delle F.S. del 13/1/1997 "Sovraccarichi per il calcolo dei ponti ferroviari. Istruzioni per la progettazione, l'esecuzione e il collaudo", nonché dalle Istruzioni F.S. 44/b (aggiornamento 14/4/1998) limitatamente alle combinazioni di carico sismiche.

Vengono riportate le verifiche per la soletta superiore ed inferiore:

Mezzeria: SLU per flessione, SLF, SLT

Nodo a un quarto dello spessore del piedritto: SLU per flessione, SLT

Nodo filo incastro: SLU per il taglio, SLF

Vengono riportate le verifiche per i montanti:

Nodo a un quarto dello spessore delle solette: SLU per flessione, SLT

Nodo filo incastro: SLU per il taglio, SLF

Campata: SLU per flessione, SLF, SLT.

Verifiche SLU

Per quanto riguarda gli stati limite ultimi sono state utilizzate due combinazioni di carico fondamentali, una statica ($\gamma_g = 1.4-1.8 (1.0)$; $\gamma_q = 1.5-1.2-0.9 (0.0)$) e una sismica ($\gamma_g = 1.4-1.8 (1.0)$; $\gamma_q = 1.5-1.2-0.9 (0.0)$; $\gamma_e = \pm 1.5$).

Si eseguono le verifiche per flessione agli stati limite ultimi fornendo le combinazioni di carico inerenti (statiche e sismiche), le sollecitazioni e i due coefficienti di sicurezza distinti: 1) $M/N = \text{cost.}$; 2) $N = \text{cost.}$ Per gli stati limite per taglio vengono riportate le verifiche imposte dal DM 09-01-1996.

Verifiche SLF

Per gli stati limite di fessurazione è stata eseguita una combinazione di carico rara specifica con il gruppo di carico accidentale gr6 ($\gamma_g = 1.0$; $\gamma_q = 0.8-0.0$) della tabella 1.7.2.3 della normativa N°I/SC/PS-OM/2298 del 2 giugno 1995. Tuttavia a favore di sicurezza, si sono presi unitari i coefficienti di combinazione Ψ .

Le verifiche allo stato limite di apertura delle fessure vengono eseguite in questi termini:

$$w_k = 1.7 \text{ wm} \leq 0.20 \text{ mm}$$

Tal limiti sono consentiti in virtù del fatto che il copriferro minimo utilizzato in tutti gli elementi strutturali è $\geq 4\text{cm}$.

| | | |
|---|--|-------------------------|
| GENERAL CONTRACTOR  | ALTA SORVEGLIANZA  | |
| | IG51-02-E-CV-CL-GA1M-0X-002-A00 Relazione di calcolo uscite di sicurezza | Foglio 61 di 2636 |

Nelle verifiche a fessurazione si sono utilizzati i seguenti parametri:

Trave prefabbricata

| | |
|--|--|
| Coefficiente di aderenza: distanza fessure | $K2 = 0.4$ |
| Coefficiente di forma: diagramma tensioni | $K3 = 0.125$ |
| Coefficiente di aderenza | $\beta1 = 1.0$ |
| Coefficiente di sollecitazione | $\beta2 = 0.5$ |
| Resistenza caratteristica del calcestruzzo | $Rck = 450 \text{ N/mm}^2$ |
| Resistenza a trazione del calcestruzzo | $fctm = 3.4159 \text{ N/mm}^2$ $fctk = 2.3911 \text{ N/mm}^2$ |

Getti solette, cordoli e diaframmi

| | |
|--|--|
| Coefficiente di aderenza: distanza fessure | $K2 = 0.4$ |
| Coefficiente di forma: diagramma tensioni | $K3 = 0.125$ |
| Coefficiente di aderenza | $\beta1 = 1.0$ |
| Coefficiente di sollecitazione | $\beta2 = 0.5$ |
| Resistenza caratteristica del calcestruzzo | $Rck = 40 \text{ N/mm}^2$ |
| Resistenza a trazione del calcestruzzo | $fctm = 3.1579 \text{ N/mm}^2$ $fctk = 2.21 \text{ N/mm}^2$ |

Verifiche SLT

Per gli stati limite di limitazione delle tensioni è stata eseguita una combinazione di carico rara nella quale, a favore di sicurezza, si sono presi unitari i coefficienti di combinazione Ψ .

Le verifiche allo stato limite di limitazione delle tensioni vengono eseguite in questi termini:

$$\sigma_c \leq 0.45 \times f_{ck} \text{ (combinazione di carico rara)}$$

$$\sigma_s \leq 0.65 \times f_{yk}$$

Inoltre a riguardo delle tensioni nelle barre di armatura si sono rispettate le limitazioni tensionali riportate nella tabella 2.2.2.4 della normativa N°I/SC/PS-OM/2298 del 2 giugno 1995.

6.5. Modelli di calcolo Straus7 – Risultati e Verifiche

6.5.1. Modello bidimensionale

Si riportano di seguito le principali verifiche delle sezioni maggiormente sollecitate sia allo stato limite ultimo che in esercizio.

Di seguito si riportano i grafici degli involuppi delle sollecitazioni agli SLU e SLE. Successivamente vengono riportate le verifiche nello specifico per tutte le sezioni.

Per maggiori dettagli sulle sollecitazioni si rimanda agli allegati numerici di output.

Si riportano di seguito le sollecitazioni, le caratteristiche geometriche, le armature necessarie nelle sezioni maggiormente sollecitate nelle varie situazioni che si possono presentare concordemente con le normative vigenti.

Tutte le verifiche sono risultate soddisfatte per tutte le sezioni e per tutte le combinazioni.

6.5.3. Verifiche soletta superiore e travi prefabbricate

La soletta in prima e seconda fase viene calcolata in semplice appoggio, infatti l'esiguo spessore dei piedritti non permette di considerare alcun grado di incastro.

Verifica in I fase - Campata

Come descritto in precedenza in prima fase lo schema statico è costituito da uno schema di semplice appoggio delle travi prefabbricate che sopportano anche il getto integrativo in via di maturazione.

Si riporta il carico agente, la luce di calcolo e le sollecitazioni flettenti derivanti in fase I in condizioni di esercizio ed ultime e le conseguenti verifiche.

$$Q = 30 \text{ kN/m};$$

$$L = 11.9 \text{ m (lunghezza a favore di sicurezza poiché presa da nodo a nodo);}$$

$$M_{ta} = 531.04 \text{ kNm}$$

$$M_{slu} = 743.456 \text{ kNm}$$

$$B = 100 \text{ cm}$$

$$H = 100 \text{ cm}$$

$$c = 5.2 \text{ cm}$$

$$A_s = 19\phi 22 + 2\phi 16$$

$$A'_s = 3\phi 16$$

$$M_{sd} \text{ I fase} = 743.456 \text{ kNm}$$

$$N_{sd} \text{ I fase} = 0 \text{ daN}$$

$$c.s. (M/N=\text{cost.}) = 2.45$$

$$c.s. (N=\text{cost.}) = 2.45$$

Verifiche in II fase

Si riportano di seguito le sollecitazioni flettenti derivanti dalle analisi con straus7.

Verifiche in campata

In figura è riportata la sezione di verifica della trave in campata.

$$B = 100 \text{ cm}$$

$$H = 120 \text{ cm}$$

$$c = 5.2 \text{ cm}$$

$$A_s = 19\phi 22 + 2\phi 16 + 6\phi 26$$

$$A'_s = 3\phi 16 + 10\phi 22$$

Verifiche del traverso

Le travi presentano 5 fori in prossimità delle chiavi di taglio e vanno a formare 5 traversi che hanno il compito di ripartire trasversalmente dei carichi non uniformi sulla soletta superiore. Tali carichi possono essere sostanzialmente quelli permanenti portati e quelli accidentali.

Si è prevista una condizione di carico che prevede l'imposizione del carico permanente ovunque mentre quello variabile massimizza alternativamente le sollecitazioni flettenti positive e negative.

Le sollecitazioni sono state calcolate usando un modello semplificato a trave continua su più appoggi.

Tenendo conto di un interasse tra i traversi pari a 2,0m si avrà:

$$Q_{perm,terreno \text{ e } p.p.} = 3 \cdot 20 \cdot 2 + (0.3 \cdot 0.15 \cdot 25 + 2 \cdot 0.2 \cdot 25) = 131.125 \text{ kN/m.}$$

$$Q_{var} = 20 \cdot 2 = 40 \text{ kN/m.}$$

L'analisi a trave continua su 5 campate di luce 1,0m e sbalzo alle estremità di 0,50m porta ai seguenti risultati:

Condizioni di esercizio:

$$M = -14.07 \text{ kNm}$$

$$M = 16.535 \text{ kNm}$$

Allo stato limite ultimo si ha:

$$M = -20.098 \text{ kNm}$$

$$M = 23.416 \text{ kNm}$$

$$V = 148.37 \text{ kN}$$

Verifica a fessurazione:

Momento positivo:

$$M = 16.535 \text{ kNm}$$

La sezione non risulta essere fessurata.

Momento negativo:

$$M = -14.070 \text{ kNm}$$

La sezione non risulta essere fessurata.

Verifica a taglio SLU:

$$V_{rd} = 0.83 \times 0.85 \times 350/1.6 \times (30 \times 4) \times 3 = 555.6 \text{ kN}$$

$$V_{ed} = 148.37 \text{ kN}$$

Essendo

n le chiavi di taglio = 3

larghezza chiave di taglio = 30 cm

spessore chiave di taglio = 4 cm

$$c.f. = 3.74$$

Appoggio trave

L'impronta di appoggio della trave prefabbricata è sempre superiore a pari a:

$$A_{impronta} = 100 \times 20 = 2 \cdot 10^5 \text{ mm}^2$$

La reazione verticale massima dovuta al peso proprio del getto nelle vare sezioni analizzate è:

$$R_{v,slu} = 1.4 \cdot 30 \cdot 11.9/2 = 249.90 \text{ kN}$$

Considerando la distribuzione delle pressioni di contatto triangolare:

$$\sigma_v = \frac{R_{v,sdu}}{A_{impronta} / 2} = \frac{249.9}{2 \cdot 2^5 / 2} = 2.50 \text{ MPa}$$

Valore inferiore alla $f_{cd} = 20.75 \text{ MPa}$.

Verifica della ali in fase di getto.

Durante la fase di getto sulle ali della trave, considerando una striscia di un metro, grava un peso pari a:

$$q = 1.2 \times 1 \times 25 = 30 \text{ kN/m}$$

6.6. Verifica effetti longitudinali da ritiro

Vengono discussi brevemente gli effetti dovuti al ritiro nel calcestruzzo che provocano stati interni di coazione con l'armatura. Scopo della trattazione è quello di verificare l'armatura minima longitudinale dello scatolare.

Per il calcolo delle coazioni interne dovute ai fenomeni di ritiro si consideri una sezione di area unitaria A_c con un'unica barra di armatura di area A_s .

Si assumono le seguenti ipotesi:

- perfetta aderenza tra calcestruzzo ed acciaio;
- deformata piana della sezione in calcestruzzo;
- comportamento del calcestruzzo e dell'acciaio elastico e lineare,

Le equazioni di equilibrio, congruenza e legame dell'insieme calcestruzzo + acciaio che governano il fenomeno sono:

$$N_c + N_s = 0 \quad (\text{equazione di equilibrio})$$

$$\varepsilon_r = \varepsilon_s - \varepsilon_c \quad (\text{equazione di congruenza})$$

$$N_c = A_c \sigma_c = A_c E_c \varepsilon_c \quad (\text{equazione legame costitutivo del calcestruzzo})$$

$$N_s = A_s \sigma_s = A_s E_s \varepsilon_s \quad (\text{equazione legame costitutivo dell'acciaio})$$

Sostituendo le equazioni di legame in quella di equilibrio ed esprimendo la deformazione del calcestruzzo in funzione di quella dell'acciaio si ha:

$$N_s = -N_c = A_s E_s A_c E_c \varepsilon_r / (A_s E_s + A_c E_c)$$

Il comportamento viscoso del calcestruzzo viene considerato attraverso l'abbattimento del modulo elastico, pertanto è necessario sostituire il valore di E_c con E^*c . La tensione sull'acciaio e sul calcestruzzo risultano quindi pari a:

$$\sigma_s = A_c E^*c E_s \varepsilon_r / (A_s E_s + A_c E^*c)$$

$$\sigma_c = -A_s E^*c E_s \varepsilon_r / (A_s E_s + A_c E^*c)$$

6.6.1. Verifiche della fondazione

Nella fondazioni è stato previsto $1\phi 16/20$ di armatura longitudinale. Tale armature provoca delle tensioni pari a:

$$\sigma_s = A_c E^*c E_s \varepsilon_r / (A_s E_s + A_c E^*c) = 43.06 \text{ MPa}$$

$$\sigma_c = -A_s E^*c E_s \varepsilon_r / (A_s E_s + A_c E^*c) = 0.062 \text{ MPa}$$

Con:

$$A_c = 14 \cdot 10^5 \text{ mm}^2$$

$$A_s = 2010 \text{ mm}^2$$

| | | |
|---|--|--------------------------|
| GENERAL CONTRACTOR  | ALTA SORVEGLIANZA  | |
| | IG51-02-E-CV-CL-GA1M-0X-002-A00 Relazione di calcolo uscite di sicurezza | Foglio 136 di 2636 |

Come si può vedere sono tensioni molto inferiori a quelle di riferimento dei materiali.

6.6.2. *Verifiche dei piedritti*

Nella fondazioni è stato previsto 1 ϕ 16/20 di armatura longitudinale. Tale armature provoca delle tensioni pari a:

$$\sigma_s = A_c E^*c E_s \epsilon_r / (A_s E_s + A_c E^*c) = 42.50 \text{ MPa}$$

$$\sigma_c = -A_s E^*c E_s \epsilon_r / (A_s E_s + A_c E^*c) = 0.10 \text{ MPa}$$

Con:

$$A_c = 9 \cdot 10^5 \text{ mm}^2$$

$$A_s = 2010 \text{ mm}^2$$

Come si può vedere sono tensioni molto inferiori a quelle di riferimento dei materiali.

6.6.3. *Verifiche della soletta superiore*

Nella fondazioni è stato previsto 1 ϕ 16/20 di armatura longitudinale. Tale armature provoca delle tensioni pari a:

$$\sigma_s = A_c E^*c E_s \epsilon_r / (A_s E_s + A_c E^*c) = 42.85 \text{ MPa}$$

$$\sigma_c = -A_s E^*c E_s \epsilon_r / (A_s E_s + A_c E^*c) = 0.072 \text{ MPa}$$

Con:

$$A_c = 9 \cdot 10^5 \text{ mm}^2$$

$$A_s = 2010 \text{ mm}^2$$

Come si può vedere sono tensioni molto inferiori a quelle di riferimento dei materiali.

7. SINTESI DELLE CONCLUSIONI

Nella presente relazione sono state affrontate le problematiche progettuali connesse con la realizzazione delle opere strutturali dell'uscita di sicurezza posta a servizio della galleria artificiale GA1M posta alla progressive km 41+800.00 circa .

Le verifiche condotte hanno dimostrato che le soluzioni progettuali proposte sono verificate a Norma di legge.
