### Other Site Characteristics

Formazioni arbustive interne a Juniperus oxycedrus sub. macrocarpa su argille "varicolori" o marne calcaree. Gola del torrente Rio Secco tra pareti verticali di arenaria. Boschi di caducifoglie a Quercus pubescens e

Ostrya carpinifolia. Il sito per le sue caratteristiche ecologiche viene attribuito alla regione biogeografica mediterranea anche se ricade per il 49% nella regione continentale all'interno dei 7 Km di buffer.

#### 4.2 Quality and importance

Il sito si caratterizza per una tipologia di habitat (ginepreti) rara nella regione Abruzzo e per la presenza del torrente che attraversa pareti rocciose con effetti di spettacolarità paesaggistica. Elevata la qualità ambientale per la diversità e la ricchezza di habitat (alcuni prioritari) che esprimono mosaico di vegetazioni, per le specie di uccelli (prioritari) e di piante mediterranee rare nella regione e vulnerabili.

### Other Site Characteristics

Morfologia estremamente varia con ghiaioni, pareti calcaree, balze rocciose, cavità carsiche, profondi valloni di origine tettonica e da erosione fluviale; complessa idrografia superficiale. Estesi boschi di faggio e di roverella. Formazione a carpino nero e vegetazione ripariale con *Salix purpurea* e *Salix eleagnos*. Nuclei di carpino bianco. Il sito per le sue caratteristiche ecologiche viene attribuito alla regione biogeografica alpina anche se ricade per il 13% nella regione continentale e per il 10% in quella mediterranea all'interno dei 7 Km di buffer.

### 4.2 Quality and importance

Elevata naturalità ed eccellente qualità ambientale. La ricchezza di habitat con la presenza di popolazione di mammiferi, uccelli, anfibi, rettili e insetti rari, endemiche e in pericolo di estinzione, testimonia la diversificazione delle unità ecosistemiche e la complessità del sito. Alta la connettività strutturale e funzionale del sistema idrico. Alto anche il valore scenico e culturale per la presenza di eremi e di grotte abitate dall'uomo in epoche passate.
