#### Other Site Characteristics

Tutta l'area è interessata dalle alluvioni quaternarie del Vara e della Magra; vi sono depositi fluviali sabbioso-ciottolosi e depositi palustri limoso-sabbiosi. Sono presenti anche arenarie compatte in banchi e strati. Nella parte alta sono presenti numerosi rii e torrenti. Il sito si identifica per massima parte con il Parco Fluviale della Magra che ora confluisce nel Parco Naturale Regionale del "Magra e Montemarcello".

#### 4.2 Quality and importance

È l'unico corso d'acqua di discreta portata e con tratto fluviale non torrentizio, che mantenga, a livello regionale, buone caratteristiche di naturalità. Alcune presenze floro-faunistiche risultano importanti per la localizzazione di margini d'areale e per la rarità a livello regionale. Gli habitat acquatici e l'intero territorio costituiscono un'importante area (la più rilevante per la Liguria) di sosta e di transito per i migratori. Il sito riveste anche un'importanza notevolissima per la conservazione di numerose specie di anfibi. Il sito ospita, oltre a specie ed habitat prioritari della direttiva 92/43 CEE, un altissimo numero di taxa protetti ai sensi di direttive/convenzioni internazionali, numerosi endemiti di particolare rilevanza e varie specie di interesse nazionale/regionale. Nel sito trovano anche *Hydroscapha gyroides*, specie ad areale fortemente disgiunto, indicatrice di qualità ambientale proposta dalla Regione Liguria per l'inserimento nell'allegato II della 92/43 CEE.
