Oggetto: Accordo di collaborazione tra Autorità Portuale ed Arpal (Decreto n.163 del 07/09/2017) per il Monitoraggio dell'inquinamento acustico derivante dalle attività portuali - campagna Maggio/Giugno 2017.

Come indicato nella nota del Comune della Spezia prot. 2017-0040230/U del 10/04/2017 (prot. ARPAL 11041 del 11/04/17), lo scrivente Dipartimento ha eseguito una campagna di monitoraggio acustico presso l'abitazione del Sig. Arduini sita in Viale S. Bartolomeo 689 – 5° piano (zona Fossamastra).

La campagna di misura si è articolata tramite l'effettuazione di misurazioni in continuo e di misure "spot" nei punti di misura di seguito dettagliati e riportati in Fig. 1 ed in Allegato I.

Sia i due monitoraggi in continuo che la misura spot sono stati eseguiti contemporaneamente.

Grazie a questa contemporaneità, nei tempi di misura sulle tre postazioni, si è potuto, come meglio descritto nei paragrafi successivi, eseguire in un confronto tra i valori misurati nello stesso acro temporale ma a differenti altezze dal piano stradale.

Dipartimento della Spezia

Via Fontevivo 21 – 19125 La Spezia

1. Punti di misura

In Allegato I vengono riportate le planimetrie e le foto dei punti di misura, mentre in Allegato III vengono riportate le specifiche schede di misura regionali (ex. DGRL n.18/00) contenenti i valori di dettaglio delle misure. In Fig.1 vengono riassunte le posizioni di misura di seguito descritte.

Punto di misura 1: Terrazzo al 5° piano del civico n.689 di Viale S. Bartolomeo – Fam. Arduini – misura in continuo.

Il punto di misura è stato scelto sia in relazione alla disponibilità dei cittadini interpellati per ospitare la strumentazione di misura, che al fine di allontanarsi dal sedime stradale poter meglio valutare l'eventuale contributo acustico dell'attività portuale. Il terrazzo scelto, infatti, sia affaccia su Viale S. Bartolomeo che sull'area portuale.

Il posizionamento della microfonia da esterno è avvenuto in un angolo del terrazzo, a circa 1,80 m dal piano di calpestio del terrazzo, al fine di mantenere una distanza adeguata sia dalle superfici riflettenti che dalla facciata dell'edificio stesso.

La misura è stata condotta in continuo per tre settimane:

- Settimana dal 26/05/2017 al 01/06/2017;
- Settimana dal 01/06/2017 al 06/06/2017;
- Settimana dal 06/06/2017 al 13/06/2017;

Tale monitoraggio è rappresentativo della rumorosità globale che investe gli edifici ad uso abitativo che si affacciano su quel tratto di Viale S. Bartolomeo e sull'area portuale. I valori risultanti da questo monitoraggio verranno confrontati con i valori limite di legge al fine di determinarne eventuali superamenti (si veda paragrafo 4).

Punto di misura 2: Laboratorio mobile ubicato c/o marciapiede Viale S. Bartolomeo antistante Terminal del Golfo - misura in continuo. La microfonia da esterno è stata posizionata sul tetto del Lab. Mobile, permettendo alla microfonia stessa di raggiungere un'altezza dal suolo pari a circa 4 m (come richiesto dall' Allegato C del DMA 16/03/98). Il monitoraggio è stato eseguito nel periodo dal 30/05/2017 al 13/06/2017.

Il monitoraggio ed è stato effettuato a titolo conoscitivo al fine di poter ottenere dei valori che,

Dipartimento della Spezia

Via Fontevivo 21 – 19125 La Spezia
Tel. +39 0187 2814236 - fax. +39 0187 2814230
PEC: arpal@pec.arpal.gov.it
giancarlo.leveratto@arpal.gov.it - www.arpal.gov.it
C.F. e P.IVA 01305930107

confrontati con quelli del punto di misura 1, potessero meglio permettere l'individuazione del contributo acustico delle sorgenti sonore dominanti la zona oggetto d'indagine e la loro eventuale concorsualità, (anche in relazione alla diversa altezza dal piano stradale rispetto al punto di misura 1).

Tali valori verranno poi confrontati, a titolo conoscitivo, con i limiti previsti dalla zonizzazione acustica per la classe nella quale è stata inserita Viale S. Bartolomeo (strada di categoria E - si veda paragrafo 4).

Punto di misura 3: Misura spot (di breve durata) c/o marciapiede Viale S. Bartolomeo antistante civico n.689. Tale misurazione di breve durata è stata eseguita in data 30/05/2017 ed è stata effettuata ad una altezza di circa 1.5 m dal sedime stradale. Anche questa misurazione è stata realizzata a titolo conoscitivo, al fine di individuare il contributo acustico della sola sorgente sonora stradale che si manifesta a quella quota dal piano stradale. Per tale misura non si eseguono confronti con valori limite di legge in quanto, non essendo una misura di lunga durata come richiede l'apposito Decreto Ministeriale, non risulta rappresentativa ai fini della vigente normativa.

Verrà invece eseguito un confronto di tale valore con i corrispondenti valori registrati dalle due centraline di monitoraggio nello stesso arco temporale della misura spot, per evidenziare il contributo acustico delle varie sorgenti sonore della zona, alle varie altezze dal suolo.

In generale, secondo il DMA 16/03/98, le misure volte a valutare il rumore stradale vanno eseguite per una settimana. Nelle postazioni 2 e 3 si sono eseguite tre settimane di misura, in quanto, come meglio indicato di seguito, non si è avuta una settimana completa di dati a causa di necessaria depurazione delle misure da eventi meteo non conformi alla normativa, dalla presenza di eventi anomali e/o accidentali e da malfunzionamenti strumentazione. Sono state quindi eseguite tre settimane di misura riportate singolarmente e valutate le rispettive medie settimanali.

MOD-CORR-02-AR rev08 del 06/12/17

Fig.1: Rappresentazione dei punti di misura.

2. Strumentazione di misura e software utilizzati

I certificati di taratura della strumentazione utilizzata sono riportati in Allegato II e di seguito viene riportata la strumentazione utilizzata nelle diverse postazioni di misura.

In generale la catena di misura, prima e dopo ogni ciclo di misura, è stata soggetta a calibrazione.

I rilievi fonometrici sono stati condotti con costante di tempo Fast, curva di ponderazione A e memorizzazione dei descrittori acustici, quali per esempio Livello sonoro equivalente L_{Aeq} , L_{Amax} , L_{Amin} , Livelli percentili L_N , etc.; inoltre sono stati registrati gli spettri di frequenza suddivisi in bande di 1/3 d'ottava.

Le misurazioni acustiche sono state condotte in ossequio alle indicazioni del D.M.16/03/98, in particolare in riferimento alle indicazioni sulle condizioni meteorologiche.

MOD-CORR-02-AR rev08 del 06/12/17

Punto di misura 1: Terrazzo 5° piano del civico n.689 di Viale S. Bartolomeo – Fam. Arduini.

Per la realizzazione di tale monitoraggio è stata utilizzata una centralina di monitoraggio in continuo dotata di fonometro integratore BK2250. In adiacenza alla stessa è stata posizionata centralina meteorologica in dotazione ad ARPAL (PCE Instruments mod. PCE-FWS 20), utilizzata per la valutazione dei parametri meteorologici durante il periodo di misura.

Successivamente all'indagine fonometrica si è proceduto all'elaborazione dati tramite i software in dotazione al fonometro, in particolare sono stati utilizzati il software BZ5503 per lo scaricamento dei dati ed il software 7820 Evaluator™ per l'analisi degli stessi.

Punto di misura 2: Laboratorio mobile ubicato c/o marciapiede Viale S. Bartolomeo antistante Terminal del Golfo. Per la realizzazione di tale monitoraggio è stata utilizzata una seconda centralina di monitoraggio in continuo dotata di fonometro integratore BK2250. Per la valutazione dei parametri meteorologici durante i periodi di misura sono stati utilizzati i dati meteo ottenuti dalla centralina meteo PCE Instruments posizionata nel punto di misura 1.

Successivamente all'indagine fonometrica si è proceduto all'elaborazione dati tramite i software in dotazione al fonometro, in particolare sono stati utilizzati il software BZ5503 per lo scaricamento dei dati ed il software 7820 Evaluator™ per l'analisi degli stessi.

Punto di misura 3: Misura spot effettuata sul marciapiede Viale S. Bartolomeo antistante civico n.689. Tale misura essendo durata circa 16 min. è stata eseguita mantenendo la presenza dell'operatore per tutta la durata della misura. Tale misura è stata effettuata mentre erano attivi i due monitoraggi nelle postazioni 1 e 2.

Per la realizzazione della misura spot è stato utilizzato il fonometro integratore LD831 e per la successiva elaborazione dei dati è stato utilizzato l'apposito software NWWin.

Questa misura spot è stata effettuata solo per avere un raffronto ulteriore tra il valore misurato a bordo strada e quello misurato a quote superiori con i monitoraggi in continuo.

3. Dati misurati

In relazione a quanto sopra esposto, sono stati prodotti i grafici di seguito riportati che rappresentano le risultanze dei monitoraggi svolti sia presso l'abitazione della Fam. Arduini che presso il Laboratorio mobile.

I grafici presentano "spazi vuoti" caratterizzati dall'assenza di dati che sono da imputarsi

Dipartimento della Spezia

Via Fontevivo 21 – 19125 La Spezia
Tel. +39 0187 2814236 - fax. +39 0187 2814230
PEC: arpal@pec.arpal.gov.it
giancarlo.leveratto@arpal.gov.it - www.arpal.gov.it
C.F. e P.IVA 01305930107

all'interruzione di alimentazione alla strumentazione di misura che ha causato una mancanza di acquisizione dei dati.

Sui restanti dati rilevati è stata effettuata una validazione degli stessi che è stata eseguita sia tramite l'ascolto delle registrazioni sonore, che ha permesso anche l'identificazione di eventi anomali ed accidentali, che tramite l'eliminazione dei giorni caratterizzati da condizioni meteo difformi da quanto prevede la vigente normativa di settore (acquisizione dei dati meteo tramite la centralina meteorologica in dotazione ad ARPAL). La necessaria operazione di validazione ha generato altre interruzioni nella continuità del dato acquisito (tali interruzioni sono riportate anche nelle schede di misura). Avendo comunque protratto le campagne di misura per tre settimane, si è comunque raccolto un numero adeguato di valori.

Quindi, in generale, i valori misurati sono stati opportunamente depurati (operazione di validazione) ed arrotondati, ed i grafici risultanti sono di seguito descritti:

- a) Nei **Grafici 1, 2, 3, 7, 8** viene rappresentato l'andamento temporale del Livello equivalente orario $L_{Aeq,h}$ riferito alle diverse settimane di misura, nelle due postazioni di misura 1 e 2. In particolare, sulla base dei valori orari misurati ($L_{Aeq,h}$) è stato graficato l'andamento dei livelli sonori caratterizzanti l'intera settimana, per ognuna delle tre settimane di misura.
- b) Nei **Grafici 4, 5, 6, 9, 10** vengono rappresentati l'andamento temporale del $L_{Aeq,h}$ della "giornata tipo" ed i valori di $L_{Aeq,TR}$ per ogni settimana di misura, nelle due diverse postazioni di misura 1 e 2. In particolare con $L_{Aeq,h}$ viene indicato il valore del livello equivalente orario e con $L_{Aeq,TR}$ il valore del livello equivalente riferito all'intero periodo di riferimento Diurno o Notturno ($L_{Aeq,D}$ $L_{Aeq,N}$). Si specifica inoltre che sono state elaborate (come emerge nelle schede di misura di Allegato III) una media settimanale sui soli giorni feriali (media da Lunedì a Venerdì) ed altre due medie settimanali comprensive anche dei giorni festivi (Lunedì-Sabato e Lunedì-Domenica). Di queste tre differenti medie settimanali si è graficata come "giornata tipo", in termini di $L_{Aeq,h}$, solo quella con i valori più cautelativi per il ricettore (valutando per entrambi i tempi di riferimento diurno e notturno i valori più elevati). Nello stesso grafico contenute i valori della sopra descritta "giornata tipo" sono stati riportati anche i singoli valori medi diurni e notturni della settimana considerata ($L_{Aeq,D}$ $L_{Aeq,N}$).

Si osserva inoltre che durante l'intero periodo di monitoraggio, dalle informazioni ricevute della Capitaneria di Porto della Spezia, da ENEL e dagli uffici di “Terminal del Golfo”, è emersa la presenza in Porto di diverse navi all'accosto sia presso Terminal del Golfo che presso Molo Fornelli, mentre non vi sono stati accosti di “navi carboniere” presso molo ENEL (Allegato IV).

4. Valutazioni

a. Limiti di legge

In relazione al confronto dei valori misurati con i limiti di legge si osserva quanto di seguito riportato.

1. Manca ancora un Regolamento di esecuzione che individui i limiti e le fasce di rispetto portuali (L.447/95) quindi, nelle aree oggetto d'indagine, verranno considerati i valori di zonizzazione acustica vigente;
2. alle infrastrutture stradali, ferroviarie, aeroportuali e marittime **non** si applica il criterio differenziale (art. 4 DPCM 14/11/97);
3. alle infrastrutture di cui al precedente punto 2 **non** si applicano i fattori di correzione di cui al punto 15 dell'Allegato del DMA 16/03/98;
4. sentito l'Ufficio viabilità del Comune di La Spezia, Viale S. Bartolomeo risulta essere classificata, secondo il Codice della Strada, in categoria E. I suoi valori limite sono quelli indicati nella Tab.2 di DPR 142 del 30/03/04, che rimandano a quelli di zonizzazione acustica della zona indagata.

In sintesi sia per la rumorosità da traffico stradale (in relazione a quanto indicato al precedente punto 4) che per quella derivante da attività portuali (in relazione a quanto indicato al precedente punto 1),

Dipartimento della Spezia

Via Fonte vivo 21 – 19125 La Spezia
Tel. +39 0187 2814236 - fax. +39 0187 2814230
PEC: arpal@pec.arpal.gov.it
giancarlo.leveratto@arpal.gov.it - www.arpal.gov.it
C.F. e P.IVA 01305930107

verranno applicati i vigenti limiti di zonizzazione acustica delle classi di appartenenza delle due postazioni di misura 1 e 2 .

Ciò premesso si precisa che l'abitazione posta al civico n.689 di Via S. Bartolomeo è classificata il classe IV, con valori limite assoluti di immissione pari a 65.0/55.0, mentre il Laboratorio mobile, essendo stato posizionato lungo la strada, al confine con l'area portuale, è classificato in classe V con valori limite assoluti di immissione pari a 70.0/60.0 dB(A).

b. Confronto dei valori misurati con i valori limite di legge

Per quanto sopra esposto e vista la concorsualità delle sorgenti, al fine di una valutazione cautelativa, per quanto riguarda la postazione di misura sita presso il civico n.689 di Via S. Bartolomeo i valori misurati verranno confrontati con quelli di classe IV pari a 65.0/55.0 dB(A), mentre per quelli risultanti dal monitoraggio eseguito presso il Laboratorio mobile verranno confrontati con quelli di classe V pari a 70.0/60.0 dB(A).

In Tab.1 e Tab. 2 si riportano, rispettivamente per le due postazioni di misura (Sig. Arduini e Laboratorio mobile) i valori limite considerati ed il quadro di sintesi dei valori misurati (opportunamente depurati ed arrotondati). Si ricorda che, come già indicato nel precedente paragrafo, sono state considerate, e quindi riportate in tabella, le medie settimanali aventi livelli di pressione sonora globalmente più rappresentativi e cautelativi per il ricettore (1^a sett.: Lun-Sab; 2^a sett.: Lun-Sab; 3^a sett.: Lun-Ven.).

Tab.1: Sintesi dei valori di LA_{eqTR} corretti (espressi in dB(A) ed arrotondati), e confronto con i valori limite di immissione dei classe IV. Postazione misura: abitazione Sig. Arduini.

Periodo di misura	Valori misurati		Valori limite assoluti di immissione Classe IV	
	D	N	D	N
dal 26/05/2017 al 01/06/2017	66.5	61.5	65.0	55.0
dal 01/06/2017 al 06/06/2017	65.0	61.5	65.0	55.0
dal 06/06/2017 al 13/06/2017	65.5	59.0	65.0	55.0

Dipartimento della Spezia

C.F. e P.IVA 01305930107

MOD-CORR-02-AR rev08 del 06/12/17

Dai valori riportati tab.1 emerge il lieve superamento dei valori limite assoluti di immissione diurni nell'ultima settimana di misura ed il superamento più consistente di quelli relativi al periodo notturno.

Si ricorda che i valori misurati inglobano il contributo acustico di tutte le sorgenti sonore che erano contemporaneamente attive al momento dell'indagine fonometrica. In particolare il rumore è caratterizzato principalmente dal rumore dell'attività dell'area portuale, quindi dal rumore da traffico veicolare, ed infine in misura minore da quello antropico, da attività commerciali ed artigianali (cantieri e rimessaggi navali) e da quello derivante dell'area Enel (come da Allegato IV durante il periodo di misura non sono state registrate presenze di navi carboniere).

Tab.2: Sintesi dei valori di LA_{eqTR} corretti (espressi in dB(A) ed arrotondati), e confronto con i valori limite di immissione di classe V. Postazione misura: Laboratorio mobile.

Periodo di misura	Valori misurati		Valori limite strada tipo E Tab.2 di DPR 142/04 Classe V	
	D	N	D	N
Dal 30/05 al 02/06/2017	66.5	60.5	70.0	60.0
Dal 07/05 al 12/06/2017	70.0	61.0	70.0	60.0

Dal confronto dei valori riportati in Tab.2 con i limiti di classe V, emerge il rispetto dei valori limite assoluti di immissione diurni ed un leggero superamento di quelli notturni.

c. Confronto tra i valori misurati in contemporanea nelle tre postazioni di misura

Di seguito verrà effettuato un confronto tra i valori della misura spot e quelli corrispondenti ai valori registrati dalle centraline di monitoraggio in continuo. Tale confronto viene svolto a titolo puramente conoscitivo, paragonando i valori misurati nel medesimo arco temporale. Si è cercato di evidenziare il differente contributo acustico generato dalle diverse sorgenti sonore presenti nella zona oggetto d'indagine, alle varie altezze dal suolo.

La misura spot è stata eseguita durante un tempo di osservazione compreso tra le ore 10.00 e le ore 11.30 del 30/05/17. Dallo stesso giorno e dalla stessa fascia oraria sono stati estrapolati i valori

Dipartimento della Spezia

Via Fontevivo 21 – 19125 La Spezia
Tel. +39 0187 2814236 - fax. +39 0187 2814230
PEC: arpal@pec.arpal.gov.it
giancarlo.leveratto@arpal.gov.it - www.arpal.gov.it
C.F. e P.IVA 01305930107

misurati nelle altre due postazioni di misura e sono stati riportati nella tabella seguente.

Tab.3: Confronto dei corrispondenti valori misurati nelle tre postazioni nella stessa fascia oraria (espressi in dB(A) ed arrotondati).

Valori misurati c/o 5° piano h microfono 16.5 m (postazione 1)	Valori misurati c/o Laboratorio Mobile h microfono 4.5 m (postazione 2)	Valori misurati c/o strada h microfono 1.5 m (postazione 3)
LAeq 66.0	LAeq 65.0	LAeq 68.0

In Tab. 3 si propone un confronto tra i valori misurati in contemporanea ma a quote diverse, nelle varie postazioni di misura; di tale confronto può essere data la seguente interpretazione:

- la postazione 3 (misura spot eseguita sul marciapiede – circa 1,5 m dal suolo) risulta caratterizzata in modo determinante dal traffico veicolare ed, in misura minore, dalla attività umana legata alla presenza di esercizi commerciali;
- la postazione 2 (Lab. Mobile– circa 4,5 m dal suolo) posta lungo Viale S. Bartolomeo ed a ridosso dell'area portuale risulta influenzata sia dal traffico veicolare che dall'attività portuale;
- la postazione 1 (5° piano di Viale S. Bartolomeo n.689– circa 16,5 m dal suolo) è risultata influenzata in modo dominante dall'attività portuale (poste in visibilità ottica con la postazione 1) in misura minore dal traffico veicolare.

Utilizzando come riferimento il valore misurato lungo il sedime stradale (dove è ovviamente dominate la sorgente sonora traffico stradale) si nota che se il contributo acustico stradale fosse la sorgente dominante presso la postazione 1, nella stessa si avrebbe, anche solo con il calcolo di una propagazione per divergenza geometrica, un valore inferiore di quello che invece è stato rilevato. Infatti presso la postazione 1 si ha un valore circa pari a quello misurato presso la postazione 2 (anche se quest'ultima è più vicina alla sorgente traffico stradale), indicando così la presenza, ai piani alti (postazione 1), di una sorgente diversa da quella stradale che risulta dominate.

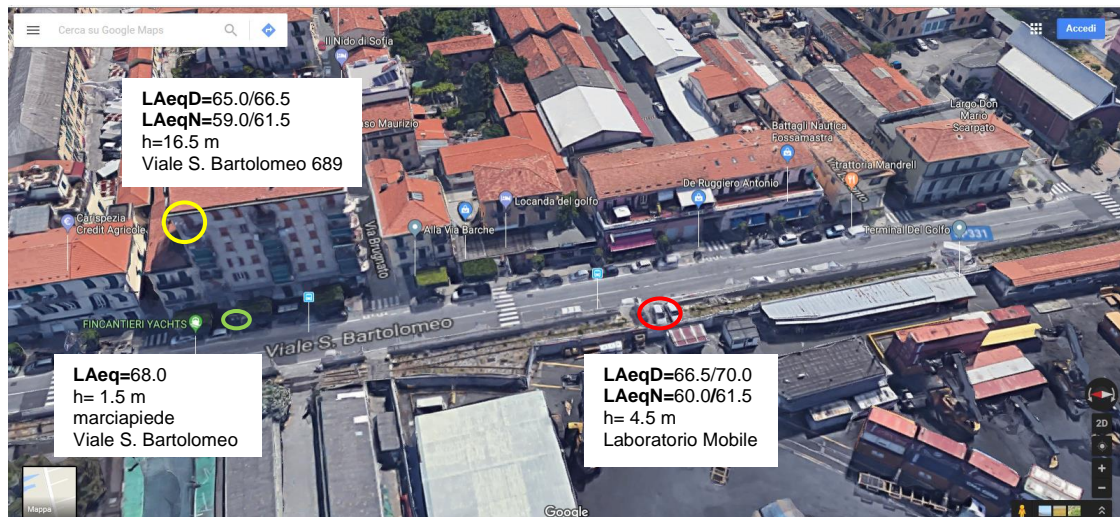

Quindi analizzando i dati ottenuti nelle varie postazioni di misura in funzione della loro quota rispetto al sedime stradale, emerge che, allontanandosi dal sedime stradale ed alzandosi via via in quota, l'attività portuale risulti dapprima concorrente (postazione 2) e poi dominante rispetto a quella stradale (postazione 1).

Dipartimento della Spezia

Via Fontevivo 21 – 19125 La Spezia

C.F. e P.IVA 01305930107

Inoltre è emersa una potenziale corrispondenza tra la presenza di toni puri presso l'abitazione e la presenza di navi attraccate al Molo Fornelli; ciò dà rilievo al contributo acustico dell'attività portuale presso la civile abitazione.

Fig.2: Rappresentazione dei valori misurati nei vari punti di misura.

d. Componenti tonali

Sebbene al punto 15 dell'Allegato del DMA 16/03/98 (come indicato nel precedente punto 3 del paragrafo 4a) non si applichino i fattori di correzione alle infrastrutture dei trasporti, si è proceduto, ai soli fini conoscitivi, a verificare la presenza di eventuali toni puri nel monitoraggio effettuato nella postazione 1.

A tal fine si sono richiesti i movimenti/accasti delle navi presso Molo Fornelli, Molo Terminal del Golfo e delle navi carboniere a servizio della Centrale Enel, si è valutata la possibile propagazione sonora in relazione alla dominanza emersa dal grafico la rosa dei venti (allegato V).

I dati raccolti relativi agli accosti riportati in allegato V hanno indicato che nel periodo di misura non vi è stata alcuna permanenza di nave Carboniera di Enel, mentre vi sono stati diversi accosti agli altri due succitati moli.

L'analisi spettrale eseguita sul monitoraggio in continuo eseguito presso l'abitazione del Sig. Arduini, unita all'analisi della direzione di prevalenza dei venti (Allegato V), ha evidenziato una possibile correlazione tra la presenza/assenza di toni puri e la presenza/assenza navi presso il Molo Fornelli (Allegato IV).

Dipartimento della Spezia

MOD-CORR-02-AR rev08 del 06/12/17

Dall'analisi in frequenza eseguita con gli appositi programmi di elaborazione dati BZ5503 ed Evaluator 7820 è emersa, presso la civile abitazione, la presenza di diversi toni puri (non sempre stazionari nel tempo) nel range di frequenza da 63 a 315 Hz. In particolare alcuni i toni puri sono stati individuati anche in alcune misure del monitoraggio svolto presso i mezzo mobile.

Nella seguente Tab.4 viene riportata, solo a titolo di esempio, la presenza di toni puri (frequenza in Hz) e la corrispondente date del monitoraggio nella postazione di misura 1 (Fam. Arduini).

Tab.4: Indicazione di alcune delle corrispondenze trovate tra i giorni di misura e toni puri presenti nei risultati del monitoraggio svolto presso la Fam. Arduini.

Data	Frequenza (Hz)
28/05/17	160/315/125
29/05/17	63/315
31/05/17	100
31/05/17	125
01/06/17	125
02/06/17	100
dal 02 al 03/06/17	125-250-315-160
04/06/17	125-315
dal 04 al 05/06/17	315
05/06/17	200-315

5. CONCLUSIONI

Dalle risultanze del monitoraggio condotto presso l'abitazione del Sig. Arduini posta al 5° piano del civico n.689 di Viale S. Bartolomeo, emerge il superamento dei valori assoluti di immissione previsti dalla vigente zonizzazione acustica, sia in orario diurno che notturno.

In considerazione delle osservazioni espresse nel precedente paragrafo 4, emerge la significatività, e dominanza ai piani alti degli edifici posti fronte mare, della sorgente sonora legata alle attività portuali.

Appare infatti che, fino ad una certa quota, l'attività portuale risulti concorrente a quella

I risultati di misura riportati nel presente Certificato sono stati ottenuti applicando le procedure di taratura citate alla pagina seguente, dove sono specificati anche i campioni o gli strumenti che garantiscono la catena di riferibilità del Centro e i rispettivi certificati di taratura in corso di validità. Essi si riferiscono esclusivamente all'oggetto in taratura e sono validi nel momento e nelle condizioni di taratura, salvo diversamente specificato.

The measurement results reported in this Certificate were obtained following the calibration procedures given in the following page, where the reference standards or instruments are indicated which guarantee the traceability chain of the laboratory, and the related calibration certificates in the course of validity are indicated as well. They relate only to the calibrated item and they are valid for the time and conditions of calibration, unless otherwise specified.

Le incertezze di misura dichiarate in questo documento sono state determinate conformemente alla Guida ISO/IEC 95 e al documento EA-4/02. Solitamente sono espresse come incertezza relativa moltiplicando l'incertezza tipo per il fattore di copertura k corrispondente ad un livello di fiducia di circa il 95%. Normalmente tale fattore è uguale 2.

The measurement uncertainties stated in this document have been determined according to the ISO/IEC Guide 98 and to EA-4/02. Usually, they have been estimated as expanded uncertainty obtained multiplying the standard uncertainty by the coverage factor k corresponding to a confidence level of about 95%. Normally, this factor is 2.
