1. Structure

The Nordex Delta4000 wind turbine class comprises speed-variable wind turbines with a rotor diameter of 149 m and a nominal power of 4500 kW, which can be adapted depending on location. The wind turbine is designed for class IIIS in accordance with IEC 61400-1 or wind zone S in accordance with DIBt 2012 and is available in 50 Hz and 60 Hz variants.

A class Nordex Delta4000 wind turbine consists of the following main components:

- Rotor, with rotor hub, three rotor blades and the pitch system
- Nacelle with drive train, generator, yaw system, medium-voltage transformer and converter
- Tubular tower or hybrid tower with MV switchgear on a foundation

1.1 Tower

A class Nordex Delta4000 wind turbine can be erected on a steel tower or on a hybrid tower. The steel tower is cylindrical and consists of 4 or 5 sections. This tower is bolted to the anchor cage embedded in the foundation. The bottom part of the hybrid tower consists of a concrete tower and the top part of a tubular steel tower with two sections.

Corrosion protection is ensured by a tower surface coating system in accordance with ISO 12944. A service lift, the vertical ladder with fall protection system as well as resting and working platforms inside the tower allow for a weather-protected ascent to the nacelle.

The foundation design of all towers depends on the ground conditions at the intended site.

The tower base contains a low-voltage cabinet with control units and the medium-voltage switchgear.

1.2 Rotor

The rotor consists of the rotor hub with three pitch bearings and three pitch drives for blade adjustment as well as three rotor blades.

The **rotor hub** consists of a base element with support structure and a spinner. The base element consists of a stiff cast structure, on which the pitch bearings and the rotor blades are assembled. The rotor hub is covered with the spinner which enables the direct access from the nacelle into the rotor hub.

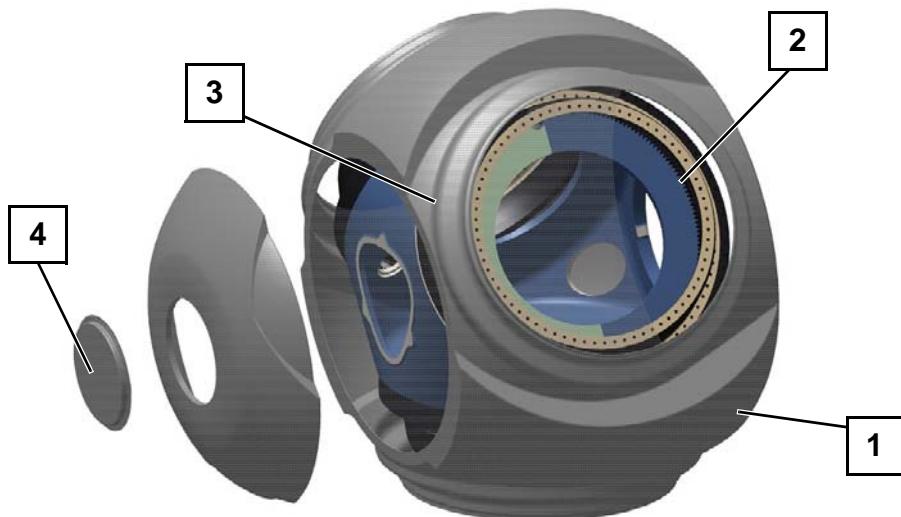

Fig. 1 Rotor hub and spinner or the Nordex Delta4000

- | | | | |
|---|---|---|------------------------|
| 1 | Spinner segment | 2 | Rotor hub base element |
| 3 | Spinner support structure (not visible) | 4 | Escape hatch |

The **rotor blades** are made of high-quality glass-fiber reinforced and carbon-fiber reinforced plastics. The rotor blade is statically and dynamically tested in accordance with the guidelines IEC 61400-23 and DNVGL-ST-0376 (2015). Optionally the rotor blades can be equipped with serrations, which optimize the sound power level.

The **pitch system** serves to adjust the pitch angle of the rotor blades set by the control system. For each individual rotor blade the pitch system comprises an electromechanical drive with 3-phase motor, planetary gear and drive pinion, as well as a control unit with frequency converter and emergency power supply. Power supply and signal transfer are realized through a slip ring in the nacelle.

1.3 Nacelle

The nacelle contains essential mechanical and electrical components of the wind turbine. The nacelle can be pivoted on the tower.

The **rotor shaft** is mounted in the rotor bearing in the nacelle. A rotor lock is integrated in the rotor bearing, with which the rotor can be reliably locked in place mechanically.

The **gearbox** increases the rotor speed until it reaches the speed required for the generator.

The bearings and gearings are continuously lubricated with oil. A 2-stage pump enables the oil circulation. A combined filter element with integrated coarse, fine and superfine filter removes solids. The control system monitors the contamination of the filter element.

The gear oil used for lubrication also cools the gearbox. The temperatures of the gearbox bearings and the oil are continuously monitored. If the optimum operating temperature is not yet reached, a thermal bypass directs the gear oil

directly back to the gearbox. If the operating temperature of the gear oil is exceeded it is cooled down.

The gearbox cooling is realized with an oil/water cooler that is installed directly at the gearbox. The heated cooling water is cooled together with the cooling water of the generator, converter and transformer in a passive cooler on the roof of the nacelle.

The **generator** is a 6-pole doubly-fed induction machine. An air/water heat exchanger is mounted on the generator. The cooling water is recooled together with the cooling water of the other large components in a passive cooler on the nacelle roof.

The **mechanical rotor brake** is used to lock the rotor during maintenance.

The **yaw drives** optimally rotate the nacelle into the wind. The yaw drives are located on the machine frame in the nacelle. A yaw drive consists of an electric motor, multi-stage planetary gear, and a drive pinion. The drive pinions mesh with the external teeth of the yaw bearing.

When the nacelle is properly positioned it is locked by means of the yaw drives.

If necessary, the oil pressure for the rotor brake is generated by a hydraulic pump.

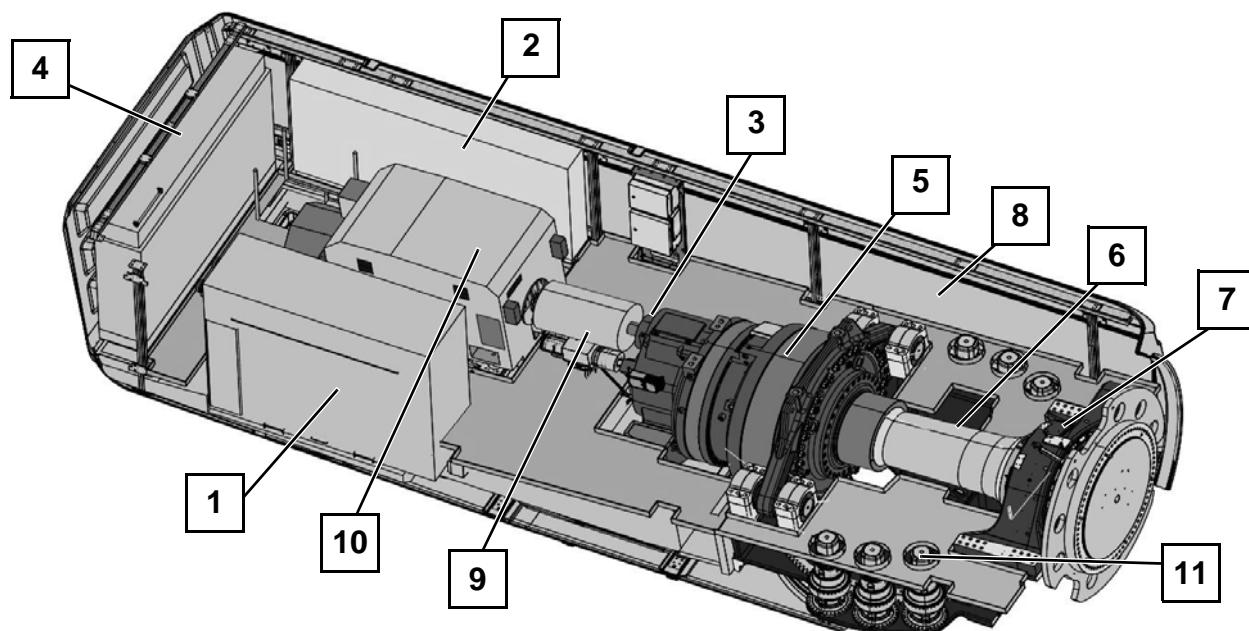

Fig. 2 Schematic representation of the nacelle

1	Transformer	2	Switch cabinet	3	Rotor brake
4	Converter	5	Gearbox	6	Rotor shaft
7	Rotor bearing	8	Nacelle housing	9	Coupling
10	Generator	11	Yaw drives		

1.4 Auxiliary systems

Generator bearing, pitch gearing and yaw gearing are each equipped with an **automatic lubrication system**.

Gearbox, generator, the cooling circuit and all switch cabinets are equipped with **heaters**.

An electric **chain hoist** is installed in the nacelle which is used for lifting tools, components and other work materials from the ground into the nacelle. A second, movable **overhead crane** is used for carrying the materials within the nacelle.

Various options of additional equipment are available for the wind turbine.

Cooling system

Gearbox, generator, converter and transformer are cooled via a coupled air/water heat exchanger. A pump conveys the mixture through the heat exchanger. At startup the lightly heated gear oil is directly fed back into the gearbox via a thermal bypass and only directed into the plate-type heat exchanger after reaching operating temperature.

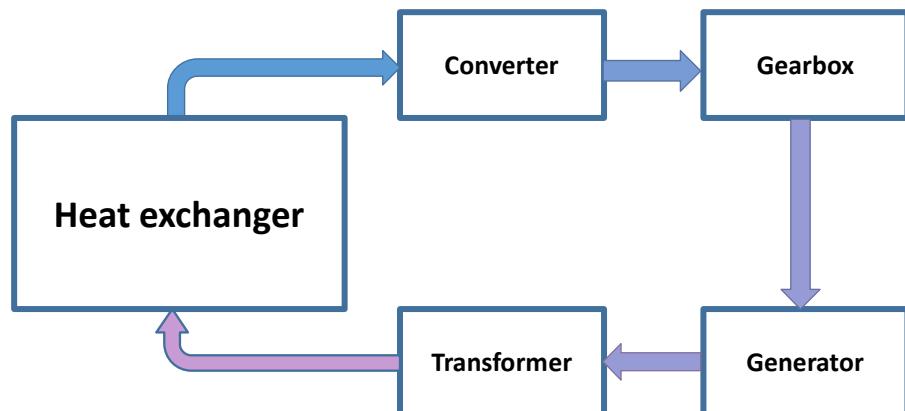

Fig. 3 Schematic diagram of the cooling of the large components in the nacelle

2. Medium-voltage switchgear

The medium-voltage components are used to connect a WT to the medium-voltage grid in the wind farm or to the grid of the local grid operator. The **MV switchgear** is located in the tower base. It consists of a transformer panel with circuit breaker, two or three ring cable units as standard or four as option (depending on the WF configuration) and a pressure absorber duct. The transformer panel consists of a vacuum circuit breaker and the disconnector with ground switch. The ring cable panel consist of a switch disconnector with a ground switch. The entire MV switchgear is assembled on a support/adapter frame.

Additional properties of the MV switchgear:

- Routine tests of each switchgear in compliance with IEC 62271-200
- Type tested, SF6 insulation
- Indoor switchgear for self-contained electrical operating sites (min. IP2X)
- SF6 tank: metal-clad, metal-enclosed (min. IP65), independent of environmental influences
- Switch positions shown "On – Off – Grounded"
- Test terminal strip for secondary test
- Low-maintenance in accordance with class E2 (IEC 62271-100)

The system protection of the MV switchgear is achieved through the following items:

- Pressure relief by pressure absorber duct in case of arcing
- Improved personal safety and system protection in case of arcing by type testing in compliance with IEC 62271-200
- Protective device with inrush detection and supplied by converter current as definite-time overcurrent relay
- Actuating openings for switchgear are interlocked to preclude operation of more than one simultaneously, and can be locked as an option
- Corrosion protection of the switchgear cells through hot-dip galvanization and painted surfaces

Transformer and converter are located in the nacelle. The transformer has been specified in accordance with IEC 60076-16 and meets the ecodesign requirements in compliance with 548/2014/EU. The transformer protection level is IP54.

The steel components at the transformer have been designed in accordance with corrosion protection class C3 (H).

Other protection measures:

- Grounded shell
- Overtemperature protection through PT100 temperature sensors and relays

3. Functional principle

The turbine operates automatically. A programmable logic controller (PLC) continuously monitors the operating parameters using various sensors, compares the actual values with the corresponding setpoints and issues the required control signals to the WT components. The operating parameters are specified by Nordex and are adapted to the individual location.

When there is no wind the WT remains in idle mode. Only various auxiliary systems are operational or activated as required: e.g., heaters, gear lubrication or PLC, which monitors the data from the wind measuring system. All other systems are switched off and do not use any energy. The rotor idles. When the optional SATCOM function has been enabled, the converter remains in operation and enables reactive power supply to the grid. When the cut-in wind speed is reached, the wind turbine will change to the mode 'Ready for operation'. Now all systems are tested, the nacelle turns into the wind and the rotor blades turn into the wind. When a certain speed is reached, the generator is connected to the grid and the WT produces energy.

At low wind speeds the WT operates at part load. During this the rotor blades remain fully turned into the wind. The power produced by the WT depends on the wind speed.

When the nominal wind speed is reached, the WT switches over to the nominal load range. If the wind speed continues to increase, the speed control changes the rotor blade angle so that the rotor speed and thus the power output of the WT remain constant.

The yaw system ensures that the nacelle is always optimally aligned to the wind. To this end, two separate wind measuring systems located on the nacelle measure the wind direction. Only one wind measuring system is used for the control system, while the second system monitors the first and takes over in case the first system fails. If the measured wind direction deviates too greatly from the alignment of the nacelle, the nacelle is yawed into the wind.

The wind energy absorbed from the rotor is converted into electrical energy using a doubly-fed induction machine with slip ring rotor. Its stator is directly connected to the MV transformer, which connects the wind turbine to the grid, and its rotor via a specially controlled frequency converter. Thus only part of the power must be routed via the converter, permitting low electrical system loss.

Safety systems

Nordex wind turbines are equipped with extensive equipment and accessories to provide for personal and turbine safety and ensure continuous operation. The entire turbine is designed in accordance with the Machinery Directive 2006/42/EC and certified as per IEC 61400. For details on the safety devices refer to the current safety manual.

If certain parameters concerning turbine safety are exceeded, the WT will cut out immediately and is put into a safe state. Depending on the cut-out cause, different brake programs are tripped. In case of external causes, such as exces-

sive wind speeds or if the operating temperature is not met, the wind turbine is softly braked by means of rotor blade adjustment.

Lightning/surge protection, electromagnetic compatibility (EMC)

The lightning/surge protection of the wind turbine is based on the EMC-compliant lightning protection zone concept, which comprises the implementation of internal and external lightning/surge protection measures under consideration of the standard IEC 61400-24.

The wind turbine falls into lightning protection level I. All components of the internal and external lightning/surge protection are designed in accordance with lightning protection level I.

The wind turbine with the electrical equipment, consumers, the measurement, control, protection, information and telecommunication technology meets the EMC requirements according to IEC 61400-1, item 10.11.

Low-voltage network types

The **660 V low voltage network** is grounded as an IT system and a three-phase system and is the primary low-voltage electrical system of the wind turbine. The elements of the electrical equipment and measuring instruments of this network are grounded directly or by means of separate protective bonding conductors. A central insulation monitor was installed as another protective measure for personal and turbine safety in the 660 V IT system.

The **400 V/230 V low-voltage network** has its neutral point grounded directly at the supplying network transformers as TN system and three-phase system. The equipment grounding conductor PE and the neutral conductor are available separately. The bodies of the electrical equipment and consumers are connected directly and straight to the neutral points of the supplying network transformers via equipment grounding conductors, including the protective equipotential bonding. The 400 V/230 V low voltage network is the auxiliary low voltage system of the wind turbine.

Auxiliary power of the wind turbine

The auxiliary low voltage required by the wind turbine in stand-by mode and feed-in mode is requested by the following consumers:

- Wind turbine control including main converter control
- 400 V/230 V auxiliary power of the main converter
- 230 V AC UPS supply including 24 V DC supply
- Yaw system
- Pitch system
- Auxiliary drives such as pumps, fans and lubrication units
- Heaters and lighting

- Auxiliary systems such as service lift, obstacle lights

Based on measurements, simulations and existing operating experience, a coincidence factor of 0.6 can be estimated for the installed low voltage auxiliary power for the worst load case of the auxiliary low voltage system as well as the feed-in operation mode of the WT. In the worst load case as well as in stand-by mode of the WT, a coincidence factor of 0.2 is estimated. In addition, measurements and simulations show that the average power factor $\cos(\phi)$ at the supply points of the auxiliary low voltage system does not permanently fall below approx. 0.97 in any WT operating point/load case.

Long-term measurements show that the average base load (average active power) of the auxiliary low voltage system during WT feed-in operation mode is approx. 15 kW, based on one year.

Wind turbines at sites with an average annual wind speed of 6.5 m/s have an internal consumption of approx. 10,000 kWh. This value, however, depends greatly on the site. The internal consumption is defined as the energy that the WT consumes from the grid in the time period during which the WT does not feed current into the grid.

4. Technical data

Design	
Design temperature	Standard -20 °C to +45 °C CCV -40 °C to +45 °C
Operating temperature range	-20 °C to +40 °C ¹⁾
Operating temperature range CCV	-30 °C to +40 °C ¹⁾
Standstill	Standard: -20 °C, restart at -18 °C CCV: -30 °C, restart at -28 °C
Max. height above MSL	2000 m ²⁾
Certificate	In accordance with IEC 61400-1 and DIBt 2012
Type	3-blade rotor with horizontal axis Up-wind turbine
Output control	Active single blade adjustment
Nominal power	4500 kW ¹⁾²⁾³⁾
Nominal power starting at wind speeds of (at air density of 1.225 kg/m ³)	Approx. 11.5 m/s
Operating speed range of the rotor	6.43 min ⁻¹ to 12.25 min ⁻¹
Nominal speed	10.7 min ⁻¹
Cut-in wind speed	3 m/s
Cut-out wind speed	20 m/s ⁴⁾
Cut-back-in wind speed	19.5 m/s ⁴⁾
Calculated service life	At least 20 years

1) Nominal power is reached up to defined temperature ranges. Limited project-specific operating ranges are possible and must be agreed to with Nordex.

2) At installation altitudes above 1000 m, the nominal power is reached up to defined temperature ranges.

3) Project-specific adjustments between 4000 and 4500 kW are possible.

4) Temperature-dependent adjustments are possible

Towers	TS105	TS125	TCS164
Hub height	105 m	125 m	164 m
Wind class	DIBt S/ IEC S	DIBt S/ IEC S	DIBt S/ IEC S
Number of tower sections	4	5	2 steel sections 1 concrete part
Layout drawing	E0004109731	E0004043036	E0003944701

Rotor	
Rotor diameter	149.1 m
Swept area	17460 m ²
Nominal power/area	257.7 W/m ²
Rotor shaft inclination angle	5 °
Blade cone angle	3.5 °

Rotor blade	
Materials	Glass-fiber and carbon-fiber reinforced plastic
Total length	72.40 m

Rotor shaft/rotor bearing	
Type	Forged hollow shaft
Materials	42CrMo4 or 34CrNiMo6
Bearing type	Spherical roller bearing
Lubrication	Regularly with lubricating grease

Mechanical brake	
Type	Actively actuated disk brake
Location	On the high-speed shaft
Number of brake calipers	1
Brake pad material	Organic pad material

Gearbox	
Type	Multi-stage planetary gear + spur gear stage
Gear ratio	50 Hz: i = 113.5 60 Hz: i = 136.2
Lubrication	Forced-feed lubrication
Oil quantity including cooling circuit	Max. 650 l
Oil type	VG 320
Max. oil temperature	77 °C
Oil change	Change, if required

Electrical system	
Nominal power P_{nG}	4500 kW*
Nominal voltage	3 x AC 660 V $\pm 10\%$ (specific to grid code)
Nominal current at full reactive current feed-in I_{nG} at S_{nG}	4503 A
Nominal apparent power S_{nG} at P_{nG}	5148 kVA
Power factor at P_{nG}	1.00 as default setting 0.869 underexcited (inductive) up to 0.885 overexcited (capacitive) possible
Frequency	50 and 60 Hz

* Nominal power is reached within defined voltage ranges. Limited project-specific operating ranges are possible and must be agreed to with Nordex.

NOTE

The nominal power is subject to system-specific tolerances and varies by ± 100 kW. Practice has shown that negative deviations occur rarely and in most cases are <25 kW. For precisely complying with external power specifications the nominal power of the individual wind turbine can be parameterized accordingly. Alternatively, the wind farm can be parameterized accordingly using the Wind Farm Portal®.

Transformer*		
Total weight	Max. 9 t	
Insulating material	Cast resin or ester	
Rated voltage OV, U_r	0.66 kV	
Maximum rated voltage OV, dependent on MV grid, U_r	Up to 33 kV	
Taps, overvoltage side	$\pm 2 \times 2.5\%$	
Rated frequency, f_r	50/60 Hz	
Vector group	Dy5	
Power factor, cos(phi)	0.90 inductive/capacitive	
Installation altitude (above MSL)	Up to 2000 m	
Rated apparent power S_r	5000 kVA ¹⁾	
Impedance voltage, u_z	8 to 9 % $\pm 10\%$ tolerance	
Minimum Peak Efficiency Index, η	99.483 % / 99.354 % ²⁾	
Inrush current	$12 \times I_N$	
Power loss	Dry-type transformer (20 kV) No load losses Short-circuit losses	Ester transformer (33 kV) 2750 W 38900 W

- 1) The values apply to a nominal power of 4500 kW; project-specific adjustments are possible
 2) Values for liquid-filled or dry-type transformer
 All values are maximum values. The values may deviate depending on the rated voltage, rated apparent power and WT active power

MV switchgear	
Rated voltage (dependent on MV grid)	24 or 36 kV
Rated current	630 A
Rated short-circuit duration	1 s
Rated short-circuit current	16 kA, 20 kA, 25 kA (for 36 kV only)
Minimum/maximum ambient temperature during operation	NCV: -25 °C to +40 °C CCV: -30 °C to +40 °C
Connector type	Connector cone type C according to EN 50181
Circuit breaker	
Number of switching cycles with rated current	E2
Number of switching cycles with short-circuit breaking current	E2
Number of mechanical switching cycles	M1
Switching of capacitive currents	Min. C1 – low
Disconnect	
Number of switching cycles with rated current	E3
Number of switching cycles with short-circuit breaking current	E3
Number of mechanical switching cycles	M1
Disconnect	
Number of mechanical switching cycles	M0
Ground switch	
Number of switching cycles with rated short-circuit breaking current	E2
Number of mechanical switching cycles	≥1000

Generator	
Degree of protection	IP 54 (slip ring box IP 23)
Nominal voltage	660 V
Frequency	50 and 60 Hz
Speed range	50 Hz: 730 to 1390 min ⁻¹ 60 Hz: 876 to 1668 min ⁻¹
Poles	6
Weight	Approx. 10.6 t

Gearbox cooling and filtration	
Type	1st cooling circuit: Oil circuit with oil/water heat exchanger and thermal bypass 2nd cooling circuit: Water/air together with generator cooling
Filter	Coarse filter 50 µm / fine filter 10 µm / super fine filter: <5 µm
Flow rate	Stage 1: approx. 100 l/min / stage 2: approx. 200 l/min

Generator and converter cooling	
Type	Water circuit with water/air heat exchanger and thermal bypass
Flow rate	Approx. 160 l/min
Coolant	Water/glycol-based coolant

Transformer cooling	
Type	1st cooling circuit: Version 1: Ester circuit with ester/water heat exchanger Version 2: Closed air circuit with water/air heat exchanger 2nd cooling circuit: Water/air together with generator, converter and gearbox

Pitch system	
Pitch bearing	Double-row four-point contact bearing
Gearing/raceway lubrication	Automatic lubrication unit with grease
Drive	Electric motor incl. spring-actuated brake and multi-stage planetary gear
Emergency power supply	VRLA batteries

Yaw drive	
Motor	Electric motors incl. spring-actuated brake
Gearbox	4-stage planetary gear
Number of drives	6
Lubrication	Oil, ISO VG 150
Yaw speed	Approx. 0.5 °/s
Brakes	Electric spring-applied brake on every driving motor

Nordex N149/4.0-4.5 – Noise level measurement requirementsBasis:

The specified sound power levels are expected values in terms of statistics. Results of single measurements will be within the confidence interval according to IEC 61400-14 [4].

Remarks:

Verification according to:

Measurements are to be carried out by a measuring institute accredited for noise emission measurements at wind turbines according to ISO/IEC 17025 [3] at the reference position as defined in IEC 61400-11 [1]. The data analysis must be carried out according to the preferred method 1 of IEC 61400-11 [1]. The tonal penalties in the vicinity of wind turbines K_{TN} based on these measurements are to be determined according to „Technische Richtlinien für Windenergieanlagen“ [2].

Tonality:

The noise can be tonal in the vicinity of wind turbines. The specified sound power level includes potential tonal penalties according to „Technische Richtlinien für Windenergieanlagen“ [2], without taking into account any tonality $K_{TN} \leq 2$ dB.

Nordex N149/4.0-4.5 – Verification conditions power curve

Basis:

These power curve values according to IEC 61400-12-1 are based on aerodynamic calculations by Nordex Energy GmbH.

Determinations for the power curve verification:

Verification according to:	IEC 61400-12-1
Type of anemometer:	Thies First Class (Advanced) or Vector A100
Type of LiDAR:	Windcube V2 or Zephir 300
Measurement of power:	low voltage side, 660/690 VAC
Air density:	normalization to the nearest air density shown in the table
Filter of turbulence intensity:	$9\% \leq TI \leq 20\%$
Filter of wind shear:	$0 \leq \alpha \leq 0.3$
	Wind shear measurement and determination according to the requirements of MEASNET power performance measurement procedure, Version 5, December - 2009, chapter 3.3 and 3.8
Filter of inflow angle:	$-2^\circ \leq \psi \leq +2^\circ$
Filter of temperature:	$\theta \leq 25^\circ\text{C}$
Ice / snow on the blades:	No (determined with ice detectors)
Filter of grid voltage U (for mode 2.a and 5.a only):	$U > 92\% U_N$ (of nominal voltage U_N)
Filter of grid reactive power:	Power factor = 1.0
Status signal:	Ready for unlimited operation in the corresponding operational mode without consideration of the cut-out hysteresis

Nordex N149/4.0-4.5 – General remarks thrust curves**Basis:**

The represented thrust coefficients are based on aerodynamical calculations by the Nordex Energy GmbH. The thrust curves are only for information and will not be warranted.

Title: SG 4.5-145 FLEXIBLE RATING PERFORMANCE SPECIFICATION		

1 AIM

This document describes the FLEXIBLE RATING functionality for the SG 4.5-145 wind turbine.

2 SCOPE

In order to have the best product and solution for our clients, SGRE SG 4.5-145 wind turbine is designed including OPTIMAFLEX philosophy: wind turbine rated power and tower configurations can be highly adapted case by case. Within OPTIMAFLEX, this document describes the FLEXIBLE RATING functionality (modification of the wind turbine rated power).

The information included in the present document is applicable to SG 4.5-145 wind turbine configuration with following hypothesis:

- STD thermal configuration.
- Altitude up to 1000m. For altitudes above this value, power de-ratings due to altitude and external ambient temperature shall be considered.

3 ABBREVIATIONS

- **WT:** Wind turbine.
- **OPTIMAFLEX:** Design philosophy aiming to a highly adaptable product that includes wind turbine rated power and tower configurations optimization.
- **FLEXIBLE RATING:** Within OPTIMAFLEX, functionality that allows increase/decrease WT rated power if specific conditions related to temperature, noise, reactive power production, grid conditions and mechanical loads are fulfilled.
- **AM:** Application Mode.
- **Maximum temperature (Text):** Expressed in °C, it is the maximum ambient temperature outside of the nacelle allowed for each Application Mode.
- **Power coefficient (cos PHI):** Reactive and active power ratio. Cos phi equals to 1 means no reactive power production.
- **Nominal Voltage (Un):** Nominal Voltage.
- **Grid frequency (f):** Grid frequency 50/60Hz.
- **Power (P):** Expressed in kW, this is the electric power obtained at the generator terminals without considering the losses in the transformer or high voltage cables of the wind turbine, or the occasional power consumption which may exist in the same to supply a component. Averaged every 10 minutes.
- **Wind speed (Ws):** Expressed in m/s, it is the horizontal wind component value at the height of the hub averaged every 10 minutes.
- **Power curve (PC):** Represents the change in the P in accordance with the W_s for the different WT operating modes.

SIEMENS Gamesa RENEWABLE ENERGY	GENERAL CHARACTERISTICS MANUAL	Code: GD369632-en	Rev: 0
Title:	SG 4.5-145 FLEXIBLE RATING PERFORMANCE SPECIFICATION	Date: 22/06/2018	Pg. 4 of 34

- **Annual Output / Annual Energy Production (AEP):** Expressed in [MWh], it is the total electrical energy produced by a wind turbine during a one-year period, in accordance with a given PC and a given wind distribution.
- **Wind distribution:** Weibull distribution is used for different K-distribution parameters and for annual average wind speed values (W_{ave}).
- **Power coefficient:** C_p
- **Thrust coefficient:** C_T

Title: **SG 4.5-145 FLEXIBLE RATING PERFORMANCE SPECIFICATION**

- **Noise level:** The expected sound power level values, expressed in dB(A), represent the sound power that the WT emits at the height of the hub for a given wind speed. In accordance with the IEC standard, the wind speed value (W_{10}) 10 m from the ground is used.

The noise levels shown in this document are average expected values, called Lw in IEC-61400-14. To obtain the Lwd value, as defined in IEC-61400-14, an increase of 2 dB(A) shall be considered over said Lw values.

- **dB(A):** An A type frequency filter is applied, in accordance with the IEC standard.

Title: **SG 4.5-145 FLEXIBLE RATING PERFORMANCE SPECIFICATION**

4 FLEXIBLE RATING GENERAL DESCRIPTION

SG 4.5-145 wind turbine can be configured to operate with a flexible rated power functionality enabling site specific optimization. It is designed to work at 4.5 MW rated power as baseline, but additional ratings from 4.2 MW to 4.8 MW are also available under certain project-specific and environmental conditions.

SG 4.5-145 baseline design conditions at rated power 4.5 MW are:

- Wind class IIB.
- Maximum external ambient temperature below 1000m +35°C (STD thermal configuration).
- Electrical performance description: Cos PHI 0.9 @ [0.95,1.12]Un @ ±3%frequency. 0.9Un@1.06f.

Within the Optimaflex Flexible Rating strategy, different “**Application Modes (AM)**” from 4.2 MW to 4.8 MW rated powers are defined. Each “Application Mode (AM)” is associated with specific external ambient temperature, grid and wind conditions of the site.

- From an electrical point of view, the availability of a specific rated power other than the baseline 4.5 MW depends on several factors, such as: ambient temperature, reactive power production, grid voltage and grid frequency.
- From a mechanical loads point of view, it is possible to modify the rated power depending on the specific wind conditions in the wind farm. Each site shall be analysed to verify the viability of the rated power modification and the maximum rated power value allowed in each case.

In the following table, a summary of the FLEXIBLE RATING Application Modes (AM) is presented.

AM	Rated power	Wind Conditions [1]	Maximum Temperature [2]	Electrical performance limits	Maximum Noise Emission level [dB(A)] [3]
AM-3	4.2 MW		+35°C	Cos PHI 0.9 @ [0.95,1.12]Un @ ±3%frequency 0.9Un@1.06f	106.9
AM-2	4.3 MW	More demanding wind conditions	+35°C	Cos PHI 0.9 @ [0.95,1.12]Un @ ±3%frequency 0.9Un@1.06f	107.2
AM-1	4.4 MW		+35°C	Cos PHI 0.9 @ [0.95,1.12]Un @ ±3%frequency 0.9Un@1.06f	107.5
AM0	4.5 MW	IIB	+35°C	Cos PHI 0.9 @ [0.95,1.12]Un @ ±3%frequency 0.9Un@1.06f	107.8
AM+1	4.6 MW		+30°C	Cos PHI 0.9 @ [0.95,1.12]Un @ ±2%frequency 0.9Un@1.03f	108.1
AM+2	4.7 MW	Less demanding wind conditions	+25°C	Cos PHI 0.9 @ [0.95,1.12]Un @ ±2%frequency 0.9Un@1.03f	108.4
AM+3	4.8 MW		+20°C	Cos PHI 0.9 @ [0.95,1.12]Un @ ±2%frequency 0.9Un@1.03f	108.7

[1] Each “Application Mode” is associated with a specific set of wind conditions.

[2] Maximum external ambient temperature outside nacelle, for altitudes below 1000m.

[3] Noise values presented correspond to the wind turbine configuration equipped with noise reduction add-ons attached to the blade. WTG can be supplied without noise reduction add-ons, if required, without impact in the other performance parameters.

Title: SG 4.5-145 FLEXIBLE RATING PERFORMANCE SPECIFICATION

5 FLEXIBLE RATING ELECTRICAL PERFORMANCE ADDITIONAL INFORMATION

As described in section 4, FLEXIBLE RATING allows the modification of the rated power in accordance with the conditions associated with the different "Application Modes (AM)". In the present section, further information about electrical performance under the different AM scenarios is presented.

The SG 4.5-145 FLEXIBLE RATING wind turbine reactive power capability delivered at the LV terminals of the WTG transformer is defined in the following figures. Reactive power values shown in Figure 1 and Table 1 can be permanently sustained under steady operational conditions. The variation of reactive power capability within operative voltage range is indicated in Figure 2 and Table 2. Linear interpolation between different voltage points shall be considered to obtain available Q at intermediate points.

It is also possible to offer the capability of providing Q at P=0 (when the WTG is not producing power at low winds). This is shown in the figure 3 and Table 3.

Title: **SG 4.5-145 FLEXIBLE RATING PERFORMANCE SPECIFICATION**

The FLEXIBLE RATING functionality also includes the generation of Q at P = 0 (QwP0). (According to document GD375881)

**Figure 3** Q at P=0 (QwP0)

6 FLEXIBLE RATING POWER CURVES AND NOISE

6.1 GENERAL COMMENTS

When not specified otherwise, power curve data in the following sections are calculated using the parameters from Table 5. All power curve and annual energy production values in this document are subject to the validity ranges presented in Table 6.

Frequency	50 Hz / 60 Hz
Rotor Diameter	145 m
Angle of blade tip	Pitch control regulation
Air density	1.225 kg/m ³

Table 5: Calculation parameter values for the SG 4.5-145 wind turbine power curve.

Wind Shear (10min average)	≤ 0.3
Turbulence intensity TI [%] for bin i	$5\% \frac{(0.75v_i + 5.6)}{v_i} < TI_i < 12\% \frac{(0.75v_i + 5.6)}{v_i}$
Terrain	Not complex according to IEC 61400-12-1
Upflow β [°]	$-2^\circ \leq \beta \leq +2^\circ$
Grid frequency [Hz]	± 0.5 Hz

Table 6 Validity ranges for the SG 4.5-145 wind turbine power curve.

1 AIM

This document presents the power curves and noise emission levels for the wind turbine SG 4.2-145.

2 SCOPE

The values shown in this document are applicable to all the existing configurations for the wind turbine SG 4.2-145, for standard operation mode and according to tower height. Tonality is not considered.

3 ABBREVIATIONS, DEFINITIONS

- **WT:** Wind turbine.
- **Power (P):** Expressed in kW, this is the electric power obtained at the generator terminals without considering the losses in the transformer or high voltage cables of the wind turbine, or the occasional power consumption which may exist in the same to supply a component. Averaged every 10 minutes.
- **Wind speed (W_s):** Expressed in m/s, it is the horizontal wind component value at the height of the hub averaged every 10 minutes.
- **Power curve (CdP):** Represents the change in the P in accordance with the W_s for the different WT operating modes.
- **Annual Output / Annual Energy Production (AEP):** Expressed in [MWh], it is the total electrical energy produced in a WT during a one-year period, in accordance with a given CdP and a given wind distribution.
- **Wind distribution:** The Weibull distribution is used for different K-distribution parameters and for annual average wind speed values (W_{ave}).
- **Wind speed W₁₀ [m/s]:** The wind speed value, measured at 10m above ground level.
- **Tower height (H):** Expressed in meters, is the height of the rotor center above ground level.
- **Power coefficient:** C_P
- **Thrust coefficient:** C_T
- **Noise level:** The expected sound power level values, expressed in dB(A), represent the sound power that the WT emits at the height of the hub for a given wind speed. In accordance with the IEC standard, the wind speed value (W₁₀) 10 m from the ground is used.

The noise levels shown in this document are average expected values, called Lw in IEC-61400-14. To obtain the Lwd value, as defined in IEC-61400-14, an increase of 2 dB(A) shall be considered over said Lw values.

- **dB(A):** An A type frequency filter is applied, in accordance with the IEC standard.

Title: SG 4.2-145 POWER CURVE AND NOISE

4 DESCRIPTION

When not specified otherwise, data in following sections is calculated using the parameters from Table 1. All power curve and annual energy production values in this document are subject to the validity ranges presented in Table 2.

Rated power	4.2 MW
Frequency	50Hz/60Hz
Rotor Diameter	145 m
Angle of blade tip	Pitch control regulation
Air density reference	1.225 kg/m ³

Table 1 Calculation parameter values for the SG 4.2-145 wind turbine power curve.

Wind Shear (10min average)	≤ 0.3
Turbulence intensity TI [%] for bin i	$5\% \frac{(0.75v_i + 5.6)}{v_i} < TI_i < 12\% \frac{(0.75v_i + 5.6)}{v_i}$
Terrain	Not complex according to IEC 61400-12-1
Upflow β [°]	$-2^\circ \leq \beta \leq +2^\circ$
Grid frequency [Hz]	± 0.5 Hz

Table 2 Validity ranges for the SG 4.2-145 wind turbine power curve.

Noise values included in the present document correspond to the wind turbine configuration with noise reduction add-ons attached to the blade.

Title: **SG 4.2-145 POWER CURVE AND NOISE**

5 RESULTS

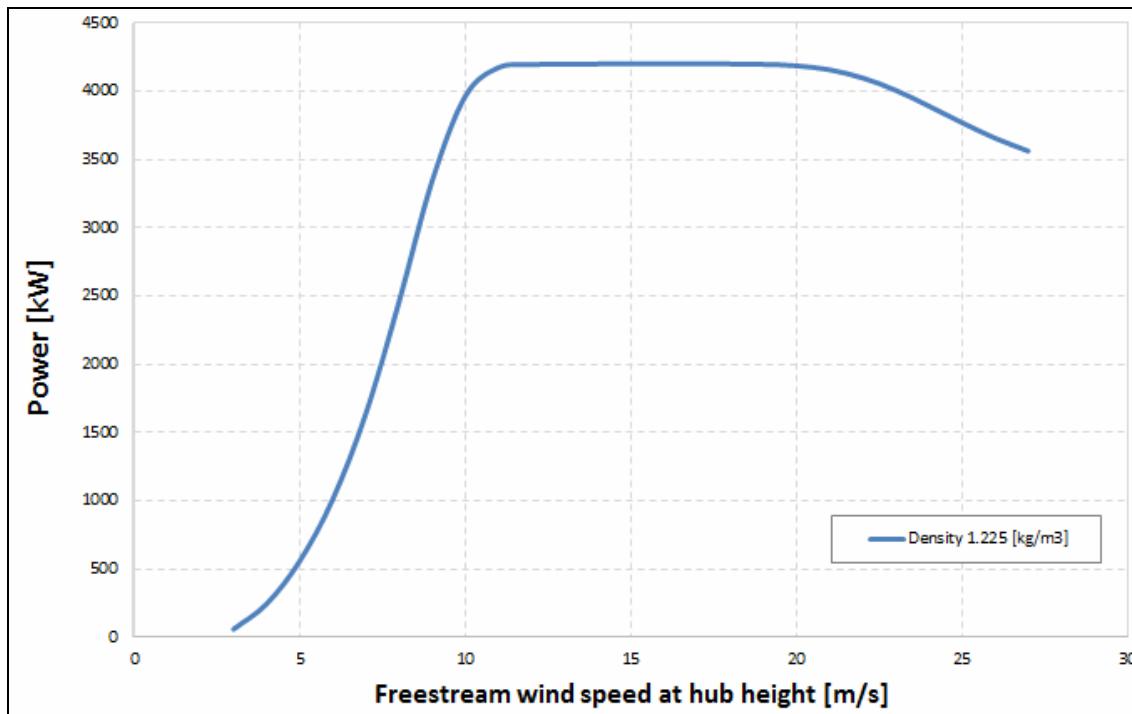

5.1 STANDARD POWER CURVES

Table 3 shows the electrical power [kW] in accordance with the horizontal wind speed [m/s] in relation to the height of the hub W_s [m/s] for different air densities [kg/m^3].

P [kW]	Density [kg/m^3]												
	WS [m/s]	1.225	0.94	0.97	1.00	1.03	1.06	1.09	1.12	1.15	1.18	1.21	1.24

See general reservations, notes and disclaimers (including, Section 5, p. 11) to this Performance Specification.

1 General Description

The Vestas V150-4.0/4.2 MW wind turbine is a pitch regulated upwind turbine with active yaw and a three-blade rotor. The Vestas V150-4.0/4.2 MW turbine has a rotor diameter of 150 m and a rated power of 4.0 MW.

Vestas offers an optional Power Optimized (PO) mode at 4.2 MW for the V150-4.0 MW variant.

2 Type Approvals and Available Hub Heights

The standard turbine is type certified according to the certification standards and available hub heights listed below:

Certification	Wind Class	Hub Height		
Tower type		Standard	Large diameter (split)	Large diameter (non-split) ⁽¹⁾
IEC61400-22	IEC IIIB/IEC S	105 m		155 m
DIBt 2012	WZ2(S), GK2	123 m	145 / 166 m	

Table 2-1: Type approval data and available hub heights

⁽¹⁾: These towers require special transport conditions as the bottom diameter is above 5 m and are not available as standard to the US/Canadian market, but can be evaluated on a case-by-case basis.

The hub height can be increased by up to 3 m by use of raised foundation. Use of raised foundation is subject to site-specific evaluation and is not available for all soil conditions.

3 Operational Envelope and Performance Guidelines

Actual climate and site conditions have many variables and should be considered in evaluating actual turbine performance. The design and operating parameters set forth in this section do not constitute warranties, guarantees, or representations as to turbine performance at actual sites.

3.1 Climate and Site Conditions

The standard turbine is designed for the wind climate conditions listed below. Values refer to hub height.

Wind Climate	IEC IIIB	IEC S
Hub Height	105/155m	105/155m
Power Rating	4.0MW	4.2MW
Extr Wind Speed (10 min average), V_{50}	37.5 m/s	37.5 m/s
Survival Wind Speed (3 s gust), V_{e50}	52.5 m/s	52.5 m/s
Turbulence Intensity, I_{V50}	11%	11%

Table 3-1: Extreme design parameters – IEC

Wind Climate	IEC IIIB	IEC S
Hub Height	105/155m	105/155m
Power Rating	4.0MW	4.2MW

Table 3-4: Average design parameters – DIBt

3.1.1 Complex Terrain

Classification of complex terrain according to IEC 61400-1:2005 Chapter 11.2. For sites classified as complex, appropriate measures are to be included in site assessment. Positioning of each turbine must be verified via Vestas Site Check.

3.1.2 Altitude

The turbine is designed for use at altitudes up to 1000 m above sea level as standard and optional up to 2000 m above sea level.

3.1.3 Wind Power Plant Layout

Turbine spacing is to be evaluated site-specifically. Spacing below two rotor diameters (2D) may require sector-wise curtailment.

NOTE

As evaluation of climate and site conditions is complex, consult Vestas for every project. If conditions exceed the above parameters, Vestas must be consulted.

3.2 Operational Envelope – Wind

Values refer to hub height and are determined by the sensors and control system of the turbine.

Wind Climate	IEC IIIB/ IEC S
Hub Height	105 / 155 m
Cut-In, V_{in}	3 m/s
Cut-Out (10 min exponential avg.), V_{out}	24.5 m/s
Re-Cut In (10 min exponential avg.)	22.5 m/s

Table 3-5: Operational envelope – wind – IEC

Wind climate	WZ2(S)
Hub height	123 / 145 / 166 m
Cut-In, V_{in}	3 m/s
Cut-Out (10 min exponential avg.), V_{out}	24.5 m/s
Re-Cut In (10 min exponential avg.)	22.5 m/s

Table 3-6: Operational envelope – wind – DIBt

3.3 Operational Envelope – Conditions for Power Curve and Ct Values (at Hub Height)

Consult Section 6 and following sections, p. 12 for power curves and Ct values.

Conditions for Power Curve and Ct Values (at Hub Height)	
Wind Shear, α	0.00-0.30 (10 minute average)
Turbulence Intensity, I	6-12% (10 minute average)
Blades	Clean
Rain	No
Ice/Snow on Blades	No
Leading Edge	No damage
Terrain	IEC 61400-12-1
Inflow Angle (Vertical)	$0 \pm 2^\circ$
Grid Voltage	Nominal Voltage $\pm 2.5\%$
Grid Frequency	Nominal Frequency ± 0.5 Hz
Grid Active Power (LV-side)	Per tabulated values in Section 6 and following sections
Grid Reactive Power (LV-side)	Power Factor 1.0

Table 3-7: Conditions for power curve and Ct values

3.4 Sound Modes

The sound modes listed below are available for the turbine.

Sound modes			
Mode No.	Maximum Sound Level	Serrated trailing edges	Available hub heights
0	104.9 dBA	Yes (standard)	105 / 123 / 145 / 155 / 166 m
0-0S	108.0 dBA	No (option)	105 / 123 / 145 / 155 / 166 m
P01	104.9 dBA	Yes (standard)	105 / 123 / 145 / 155 / 166 m
P01-0S	108.0 dBA	No (option)	105 / 123 / 145 / 155 / 166 m

Table 3-8: Available sound performance

NOTE The turbine is as standard equipped with serrated trailing edges on the blades. Optionally, Mode 0-0S can be offered without serrated trailing edges mounted on the blades.

In addition, Sound Optimized (SO) modes as listed below are available as options for the turbine.

Sound Optimized (SO) modes			
Mode No.	Maximum Sound Level	Serrated trailing edges	Available hub heights
SO1	103.4 dBA	Yes	105 / 123 / 155 / 166 m
SO2	102.0 dBA	Yes	105 / 123 / 166 m
SO3	99.5 dBA	Yes	105 / 123 / 145 / 155 / 166 m
SO11	99.2 dBA	Yes	105 m
SO12	99.9 dBA	Yes	105 m
SO13	97.0 dBA	Yes	105 m

Table 3-9: Available Sound Optimized modes

NOTE Sound Optimized (SO) modes are only available with serrated trailing edges on the blades. For further details on sound performance and in case of specific requests for sound modes per tower, please contact Vestas Wind Systems A/S.

3.5 Load Modes

The Load Optimized (LO) modes listed below are available for the turbine.

Load Optimized (LO) modes				
Mode No.	Power	Maximum Sound Level	Serrated trailing edges	Available hub heights
LO1	3.8 MW	104.9 dBA	Yes	105 / 123 / 145 / 155 / 166 m
LO2	3.6 MW	104.9 dBA	Yes	105 / 123 / 155 / 166 m

Table 3-10: Available Load Optimized modes

NOTE Load Optimized (LO) modes are only available with serrated trailing edges mounted on the blades.

4 Drawings

4.1 Structural Design – Illustration of Outer Dimensions

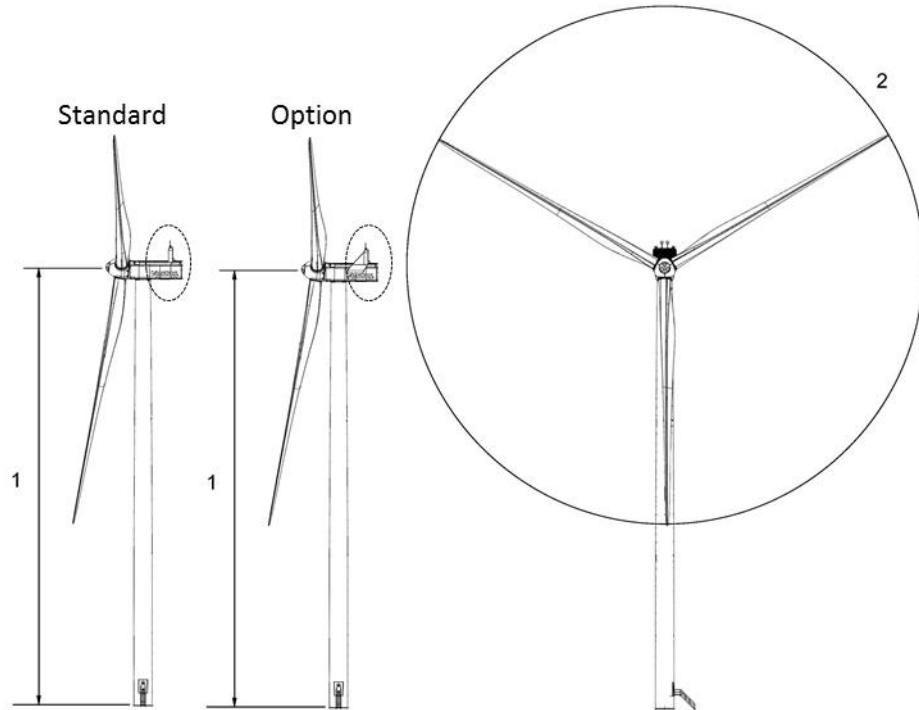

Figure 4-1: Illustration of outer dimensions – structure.

1 Hub height:
105/123/145/155/166 m

2 Diameter:
150 m

NOTE The turbine to the right is shown with side panels on the cooler top (Option).

5 General Reservations, Notes and Disclaimers

- © 2017 Vestas Wind Systems A/S. This document is created by Vestas Wind Systems A/S and/or its affiliates and contains copyrighted material, trademarks, and other proprietary information. All rights reserved. No part of the document may be reproduced or copied in any form or by any means – such as graphic, electronic, or mechanical, including photocopying, taping, or information storage and retrieval systems – without the prior written permission of Vestas Wind Systems A/S. The use of this document is prohibited unless specifically permitted by Vestas Wind Systems A/S. Trademarks, copyright or other notices may not be altered or removed from the document.
- The performance specifications described in this document apply to the current version of the V150-4.0/4.2 MW wind turbine. Updated versions of the V150-4.0/4.2 MW wind turbine, which may be manufactured in the future, may differ from these performance specifications. In the event that Vestas supplies an updated version of the V150-4.0/4.2 MW wind, Vestas will provide an updated performance specification applicable to the updated version.
- All listed start/stop parameters (e.g. wind speeds) are equipped with hysteresis control. This can, in certain borderline situations, result in turbine stops even though the ambient conditions are within the listed operation parameters.
- This document, Performance Specification, is not an offer for sale, and does not contain any guarantee, warranty and/or verification of the power curve and sound (including, without limitation, the power curve and sound verification method). Any guarantee, warranty and/or verification of the power curve and sound (including, without limitation, the power curve and sound verification method) must be agreed to separately in writing.

Third octave
noise emission

Abstract

This document serves as a paper behind the General Specification.

The document describes the measured/estimated third octave spectra for noise levels according to the General Specification.

The document is a living document and will be updated regularly.

When new measurements exist, the document might be updated.

1. Introduction

The purpose of this document is to present the expected third octave noise spectra for the V150-4.0/4.2 MW turbine. Test results for this turbine are not yet available, so data are based on test results from turbines with rotors that are as close as possible in size the V150.

Results for the turbine with Serrated Trailing Edges are based upon internal measurement results obtained on the V136 prototype turbine located at the Østerild test site in Denmark during January and February 2017.

There are no results for V136 without Serrated Trailing Edges available, so results for the turbine without Serrated Trailing Edges are based on internal measurement results on a V126-3.3 MW located at the Østerild test site in Denmark during April to June 2014.

2. Method

2.1 Procedure

During measurements, a very large number of correlated values for noise emission spectra and turbine operating parameters are identified.

From these a relation between noise emission within each 1/3 octave band, wind speed and operational conditions are extracted. By combination of these extracted values and the actual turbine operation and rotor size, an estimate of the actual 1/3 octave performance is obtained.

In order to secure that measurement system limitations are not influencing the findings, the frequency content is limited to the frequency range 6.3 Hz to 10 kHz. The stated spectral values are thus representative for the expected noise emission from the turbine at each wind speed.

The method is verified as giving results corresponding to direct measured values.

The reported wind speed range cover hub height wind speeds from 3 to 20 m/s. Extrapolations outside this wind speed range is not possible due to limitations in the measured input data.

The stated values represent the expected turbine performance, but do not in any way enable issuing guarantees on the values.

2.2 Physical environment

The results are valid for the downwind reference position as defined according to IEC 61400-11 Ed.3.

Applicable environmental conditions are thus corresponding to the standardized requirements as described directly and indirectly in IEC 61400-11.

These can be interpreted as air density 1.225 kg/m³, yaw errors below +/- 15 deg. and vertical inflow angles below +/- 10 deg. Blade condition is clean and undamaged.

Table 10: V150-4.0MW SO13, expected 1/3 octave band performance, (Blades with serrated trailing edge)

4. Limitations

The values as stated in the present document are to be regarded as “best estimates” for the octave band performance for the turbine. The values are to be regarded as informative and cannot in any way be used as guaranteed for any projects.

The complete document can be handed out as pdf and must always be referred to using the complete document DMS number.

5. Recalculation to 10 m wind speeds

In case 10 m height wind speed references are required, recalculation of the stated values can be made using the following procedure:

1. The stated hub height wind speeds are recalculated to 10 m reference height.
2. Integer 10 m height wind speed related sound power levels are calculated using linear interpolation between the nearest non-integer values.

Recalculation is made using procedures as defined in IEC 61400-11 ed.3. Appendix D.
