PREMESSA

L'impianto agrovoltaico denominato "La Feudale" sarà di tipo grid-connected con allaccio trifase in alta tensione a 150kV su rete TERNA a mezzo di sottostazione elettrica elevatrice 150/30kV. Di seguito si riportano le potenze nominali dell'impianto:

- Pdc: 32292.48kWp;
- Pac: 29363 kW a cosfi=1.

L'impianto ha una produzione di energia pari a **51216000 kWh** al primo anno (equivalente a 1586.0 kWh/kWp).

L'energia dell'impianto complessivo è derivante da 53376 moduli che occupano una superficie fotovoltaica di 151060.27m² ed è composto da 22 gruppi di conversione.

Catastalmente le opere sono di seguito localizzate:

- Aree di Impianto: Comune di Manfredonia, foglio 64 particelle 108, 74, 106, 73, 80 e 91 foglio 65 particelle 54, 51, 180 e 48;
- Aree di Impianto: Comune di San Giovanni Rotondo, foglio 149 particelle 34, 35.

Le aree risultano essere nella disponibilità di Luminora La feudale s.r.l. e localizzabili con le seguenti coordinate baricentriche nel sistema di riferimento UTM – WGS84 33N:

- Impianto agrovoltaico: latitudine 566159.96 e longitudine 4600422.53;
- Sottostazione: latitudine 557309.18 e longitudine 4602711.04.

1. RIFERIMENTI NORMATIVI

Gli impianti elettrici dovranno essere realizzati nel rispetto delle disposizioni seguenti:

− D.P.R. 27.04.1955 n. 547 e successive modificazioni;
− D.P.R. 07.01.1956 n. 164 e successive modificazioni;
− D.P.R. 19.03.1956 n. 303 e successive modificazioni;
− Legge 07.12.1984 n. 818 e successive modificazioni;
− Legge 01.03.1990 n. 186;
− Legge 18.10.1977 n. 791;
− Legge 05.03.1990 n. 46 e successive integrazioni (sostituita dal DM NR 37 del 22-01- 08);
− D.P.R. 06.12.1991 n. 447(sostituito dal DM NR 37 del 22-01-08);
− D.L. 19.09.1994 n. 626 e successive modificazioni;
− e quanto altro possa comunque interessare.

Si richiamano le prescrizioni degli Enti Locali preposti ai controlli: USL, ISPESL, Aziende distributrici elettriche, del gas, etc.

Si sottolinea che dovranno essere osservate altresì le norme: CEI, UNI e le tabelle CEI UNEL. Relativamente alle norme CEI dovranno essere rispettate quelle in vigore all'atto esecutivo dei lavori con particolare riferimento, a titolo esemplificativo, e non esaustivo, alle Norme di seguito elencate.

− Criteri di allacciamento alla rete AT della distribuzione.
− ENEL DK 5310
− CEI 99-2
− CEI 99-3
− CEI 11-4 Esecuzione delle linee elettriche aeree esterne.
− CEI 11-15 Esecuzione di lavori sotto tensione.
− CEI 11-17 Impianti di produzione, trasmissione e distribuzione di energia elettrica – linee in cavo.
− CEI 11-20 Impianti di produzione di energia elettrica e gruppi di continuità collegati a reti di I e II categoria.
− CEI 11-25 Calcolo delle correnti di cortocircuito nelle reti trifasi a corrente alternata.
− CEI EN60865-1 Calcolo degli effetti delle correnti di cortocircuito.
− CEI 11-28 Calcolo delle correnti di cortocircuito nelle reti radiali a B.T.

− CEI 17-5 (CEI EN60947-2) Interruttori automatici per B.T.

− CEI EN60947-2 (Appendice B) Dispositivi differenziali indipendenti con toroide separato.

− CEI 17-11 (CEI EN60947-3) Interruttori di manovra e sezionatori con o senza fusibili per B.T.

− CEI 17-50 (CEI EN60947-4-1) Contattori ed avviatori elettromeccanici per B.T.

− CEI 17-45 (CEI EN60947-5-1) Dispositivi per circuiti di comando e manovra in B.T.

- CEI 17-47 (CEI EN60947-6-1) Apparecchiature di commutazione automatica in B.T.
- CEI 17-48 (CEI EN60947-7-1) Morsettiere per conduttori in B.T.
- CEI 17-41 (CEI EN61095) Contattori elettromeccanici per usi domestici o similari.
- CEI 41-1 Relè ausiliari elettromeccanici.
- CEI 23-3 (CEI EN60898) Interruttori automatici per usi domestici e similari.
- CEI 23-12 (CEI EN60309-1/2) Prese a spina per usi industriali.
- CEI 23-5 Prese a spina per usi domestici e similari.
- CEI 23-50 Prese a spina per usi domestici e similari.
- CEI 23-16 Prese a spina di tipo complementare per usi domestici e similari.
- CEI 23-9 (CEI EN60669-1) Apparecchi di comando non automatici per usi domestici e similari.
- CEI EN60669-2-1/2 Relè passo/passo modulari.
- CEI 23-42 (CEI EN61008-1) Interruttori differenziali senza sganciatori di sovracorrente incorporati per usi domestici e similari.
- CEI 23-43 (CEI EN61008-2-1) Interruttori differenziali senza sganciatori di sovracorrente incorporati per usi domestici e similari.
- CEI 23-18 (CEI EN61009-2-1) Interruttori differenziali con sganciatori di sovracorrente incorporati per usi domestici e similari.
- CEI 23-44 (CEI EN61009-1) Interruttori differenziali con sganciatori di sovracorrente incorporati per usi domestici e similari.
- CEI EN61036 Contatori elettrici statici di energia attiva per corrente alternata.
- CEI EN61010-1 Strumenti di misura digitali.
- CEI EN60414/CEI EN60051 Strumenti di misura analogici.
- CEI 66-5/85-3/85-4/85-5/85-7 Strumenti di misura.
- CEI 38-1 (CEI EN60044-1) Trasformatori di corrente per misura.
- CEI 38-2 Trasformatori di tensione per misura.
- EN 60730-1/2 Termostati modulari.
- EN 61000-3-2 Interruttori crepuscolari modulari.
- CEI EN60730-1/2 Interruttori orari modulari.
- CEI 81-10 Protezione delle strutture contro i fulmini.
- CEI 37-1 Limitatori di sovratensione a resistori non lineari con spinterometri.
- CEI 37-2 Limitatori di sovratensione ad ossido di metallo senza spinterometri.
- IEC 60840 Cavi AT per posa interrata.

2. CADUTA DI TENSIONE

La caduta di tensione massima introdotta nei calcoli per la determinazione delle sezioni dei cavi non dovrà superare, ai morsetti dell'utilizzatore, il 4% della tensione nominale nel funzionamento

a regime sul lato corrente alternate (AC) ed il 2% sul lato corrente continua (DC).

Il calcolo della caduta di tensione percentuale in AC è ottenibile con la seguente relazione:

$$\Delta V\% = \mathrm{k} * \frac{\sqrt{R^2 + X^2}}{Vn} * I * \frac{L}{1000}$$

dove:

- k = 2 per line monofasi e 1,73 per linee trifasi;
- L = lunghezza della linea espressa in km;
- I = corrente trasportata espressa in A;
- R = resistenza della linea espressa in Ω/m;
- X = reattanza della linea espressa in Ω/m;
- V_n= tensione nominale in V

Il calcolo della caduta di tensione percentuale in DC è ottenibile con la seguente relazione:

$$\Delta V\% = 2 * \frac{R}{Vn} * I * \frac{L}{1000}$$

- L = lunghezza della linea espressa in km;
- I = corrente trasportata espressa in A;
- R = resistenza della linea espressa in Ω/m;
- V_n= tensione nominale in V.

3. CALCOLO DELLA PORTATA DELLE CONDUTTURE

Le portate dei cavi in regime permanente relative alle condutture installate sono state verificate secondo le Tabelle CEI-UNEL 35024/1, per posa in aria, e CEI-UNEL 35026, per posa interrata, applicando ai valori individuati, dei coefficienti di riduzione che dipendono dalle specifiche condizioni di posa e dalla temperatura ambiente.

4. PROTEZIONE DA SOVRACORRENTI

La protezione contro le sovracorrenti deve rispettare le seguenti condizioni:

a) $Ib \leqslant In \leqslant Iz$ con $Ib \leqslant In \leqslant 0{,}9\ Iz$ nel caso di fusibili

b) $If \leqslant 1{,}45\ Iz$

c) potere di interruzione (o di cortocircuito) del dispositivo di protezione non inferiore al valore della corrente di cortocircuito presunta nel punto di installazione,

Ib = corrente di impiego del circuito;

Iz = portata della conduttura;

In = corrente nominale o corrente termica di regolazione del dispositivo di protezione;

If = corrente di intervento del dispositivo entro il tempo convenzionale stabilito.

In relazione alle portate Iz ed alle condizioni a) e b), si determinano i valori di corrente nominale (o di regolazione termica) degli interruttori e fusibili posti a protezione delle singole linee.

Il potere di interruzione (o di cortocircuito) dei dispositivi di protezione non dovrà essere inferiore al valore della corrente di cortocircuito presunta in corrispondenza del punto di installazione.

Dovrà, inoltre, essere garantito il coordinamento tra l'energia specifica passante dell'apparecchiatura di protezione (integrale di Joule) e l'energia specifica passante tollerabile dai conduttori, rappresentato mediante la seguente relazione:

$$\int_0^{t_i} i^2 dt \leq K^2 S^2$$

dove:

$$\int_0^{t_i} i^2 dt$$

è l'energia specifica passante (tra t = 0 e t = ti) del dispositivo di protezione;

K = costante dell'isolante del conduttore [115 per cavi in pvc; 143 per cavi EPR];

S = sezione del conduttore [mm2].

Generalmente la protezione dei cavi in bassa tensione è affidata a fusibili e/o interruttori automatici, generalmente di tipo termomagnetico come prescritto dalle CEI 64-8 mentre al relè termico la protezione in bassa tensione del trasformatore MT/BT avente $I'_{tr} \leq I_Z$ in modo tale che la corrente di taratura riportata al primario sia minore o uguale alla portata del cavo. Va in ogni caso precisato che trattandosi di un impianto fotovoltaico è da escludersi il sovraccarico in senso classico del termine.

In seguito al cortocircuito, il cavo deve sopportare le sollecitazioni termiche in modo tale da evitare che la temperatura interna sia inferiore alla temperatura di cortocircuito ammissibile per l'isolante. La scelta della sezione più idonea da realizzare e influenzata oltre che dalle correnti che

il cavo è chiamato a trasportare ma anche dal valore efficace della corrente di corto circuito, dal tempo di eliminazione del guasto e dal materiale costituente i cavi. Valutando la sovracorrente costante con fenomeno termico di breve durata e adiabatico (regime di puro accumulo), la sezione del conduttore MT più idonea dovrà soddisfare la seguente relazione (CEI 11-17):

$K^2S^2 \geq I^2t$

S[mm2] : sezione del conduttore

K : coefficiente dipendente dal tipo di conduttore e dalle temperature iniziali e finali del cortocircuito. I valori di riferimento sono indicati in Tab 4.2.2 della CEI 11-17.

I[A] : corrente di cortocircuito

t[s] : durata della corrente di cortocircuito

Nella valutazione del coefficiente K, le temperature massime di inizio cortocircuito e di fine cortocircuito sono ottenute dalla Tab 4.2.2a della Norma CEI 11-17.

5. PROTEZIONE CONTRO I CONTATTI DIRETTI

Gli impianti devono essere costruiti in modo da evitare il contatto non intenzionale con parti attive od il raggiungimento di zone pericolose (zone di guardia) prossime alle parti attive. Si devono proteggere le parti attive, quelle con il solo isolamento funzionale, e le parti che possono essere considerate a potenziale pericoloso.

La protezione contro i contatti diretti consiste nell'impedire il contatto con le parti attive nude o di portarsi ad una distanza tale per cui possa avvenire una scarica.

A tal fine, sono state introdotte le distanze di guardia (dg), di vincolo orizzontale (dvo) e verticale (dvv). La distanza di vincolo rappresenta la distanza minima tra la parte in tensione e la superficie sulla quale un operatore al lavoro può stare in posizione eretta, con entrambi i piedi appoggiati.

Le parti attive poste ad una distanza dalla suddetta superficie inferiore alla distanza di vincolo devono essere protette con pareti o barriere metalliche con grado di protezione almeno IP1XB (il dito di prova penetra all'interno dell'involucro ma non raggiunge le parti attive). Le pareti e le barriere di protezione devono essere alte almeno 2m dal piano di calpestio.

La superficie interna della barriera deve trovarsi ad una distanza dalle parti attive (non schermate) almeno uguale a quella di guardia dg. Tale distanza può essere ridotta alla distanza minima d'isolamento se la barriera ha un grado di protezione almeno IP3X (CEI 111 art.6.2.1).

Le misure di protezione contro i contatti diretti su indicate devono essere applicate anche nei confronti dei componenti isolati ma senza schermo metallico collegato a terra, ad esempio le

terminazioni del cavo, relativamente alla parte priva di schermo, e gli avvolgimenti in MT isolati in resina o nastrati dei trasformatori a secco.

6. COLLEGAMENTO A TERRA DEI CAVI IN MT

Gli schermi dei cavi MT sono considerati mezzi di protezione sufficienti contro i contatti indiretti in quanto verificano art 5.3.1 della Norma CEI 11-17, sono messi a terra ad entrambe le estremità di ogni tratta, in corrispondenza delle terminazioni. Tale modalità di collegamento è estesa anche ad i cavi in MT utilizzati per collegamenti corti, cavi fino a circa 1 Km.

7. COLLAUDO DEI CAVI MT DOPO LA POSA

La Norma CEI 11-17 raccomanda il collaudo dei cavi MT dopo la posa. Questo tipo di collaudo e volto a verificare l'esistenza di difetti, grossolani errori di confezionamento dei giunti e terminali e danneggiamenti intervenuti durante la posa.

L'effettuazione di tale prova di collaudo può essere decisa in relazione all'importanza del tratto di cavo e alle modalità seguite nella posa.

Sono riportate le prove di tensione da effettuare per cavi con 1kV≤ U0≤ 30kV.

ISOLANTE	PROVA CON TENSIONE CONTINUA [kV]	PROVA CON TENSIONE ALTERNATA [kV]	DURATA [min]
Polietilene Reticolato	3U0	2U0	15

Per i cavi isolati in XLPE o HEPR è da evitare la prova in corrente continua che può provocare tensioni di polarizzazione che combinandosi con la tensione di rete alla messa in servizio del cavo potrebbe esporre l'isolante a tensioni elevate con possibili deterioramenti dello stesso.

8. DESCRIZIONE GENERALE DELL'IMPIANTO

L'impianto agrovoltaico sarà di tipo grid-connected, con allaccio trifase in alta tensione a 150kV sulla RTN. L'impianto complessivo ha potenza nominale 32292.48 kWp con produzione di energia pari

a 51216000kWh al primo anno (equivalente a 1586.0 kWh/kWp).

L'energia dell'impianto complessivo è derivante da 53376 moduli che occupano una superficie fotovoltaica di 151060.27m² ed è composto da 22 gruppi di conversione.

Dati tecnici	
Superficie totale moduli	151060.27 m²
Numero totale moduli	53376
Tipo di modulo	605 Wp, Si-mono facciale
Potenza DC impianto	32292.48 kWp
Potenza AC impianto	29363 kW
Struttura di sostegno moduli fotovoltaici tipo 1	N. 783 - Tracker 2x32
Struttura di sostegno moduli fotovoltaici tipo 2	N.102 - Tracker 2x16
Asse principale struttura	Nord-Sud
Energia totale annua (al primo anno)	51216000 kWh
Energia per kWp	1586.0 kWh/kWp
Irraggiamento solare annua sul piano orizzontale	1576.3 kWh/m²

L'impianto verrà suddiviso in tre cluster che si collegheranno alla sottostazione di elevazione 150/30 kV e saranno costituiti nel seguente modo:

Cluster 1	
Aree A4,1-A4,2-A5,1-A5,2	
TIPO STRUTTURA	TRACKER
TIPO MODULO	605 Wp
POTENZA MODULO [Wp]	605
N° STRUTTURE 2X32	225
N° STRUTTURE 2X16	32
N°CU	6
POTENZA DC [kWp]	9331,52
POTENZA AC (cosfi=1) [kW]	8295
DC/AC	1,1250

Cluster 2	
Aree A2-A3,1-A3,2	
TIPO STRUTTURA	TRACKER
TIPO MODULO	605 Wp
POTENZA MODULO [Wp]	605
N° STRUTTURE 2X32	149
N° STRUTTURE 2X16	38
N°CU	6
POTENZA DC [kWp]	6504,96
POTENZA AC (cosfi=1) [kW]	5800
DC/AC	1,1215

Cluster 3	
Aree A1,1-A1,2	
TIPO STRUTTURA	TRACKER
TIPO MODULO	605 Wp
POTENZA MODULO [Wp]	605
N° STRUTTURE 2X32	409
N° STRUTTURE 2X16	32
N°CU	10
POTENZA DC [kWp]	16456,00
POTENZA AC (cosfi=1) [kW]	15268
DC/AC	1,0778

9. DESCRIZIONE DELLA FONTE UTILIZZATA

La disponibilità della fonte solare per il sito di installazione è stata verificata utilizzando i dati Meteonorm. Per la località dell'intervento, sita nel territorio comunale di San Giovanni Rotondo (FG) e Manfredonia (FG), si riportano i dati ambientali.

10. PRODUCIBILITÀ

Dal punto energetico, il criterio utilizzato nella scelta dell'esposizione del generatore fotovoltaico è quello di massimizzare la quantità di energia solare raccolta su base annua.

Tutti i moduli fotovoltaici hanno la stessa esposizione al fine di contenere le conseguenti perdite di mismatching.

Nel caso degli impianti in oggetto, il generatore fotovoltaico è di tipo tracker, per ridurre le perdite di energia sul generatore fotovoltaico e quindi massimizzare la produzione di energia, sono state fatte le seguenti scelte progettuali:

- le caratteristiche elettriche dei moduli (corrente di cortocircuito e corrente alla massima potenza) facenti parte della stessa stringa sono, per quanto possibile, identiche tra loro in modo da limitare le perdite di potenza per mismatching di corrente;
- le caratteristiche elettriche delle stringhe (tensione a vuoto e tensione alla massima potenza) facenti parte dello stesso campo fotovoltaico sono, per quanto possibile, identiche tra loro in modo da limitare le perdite di potenza per mismatching di tensione;
- il dimensionamento dei cavi è stato eseguito, in modo da limitare le cadute di tensione. La caduta di tensione sul lato in corrente continua non è superiore a 2 % mentre la caduta di tensione tra il trasformatore di potenza e il punto di consegna non è superiore a 0.5 %;
- la scelta della tensione del generatore fotovoltaico è stata fatta in modo da ridurre le correnti in gioco e quindi le perdite di potenza per effetto Joule.

L'energia totale annua prodotta al primo anno è 51216000 kWh.

Tutti i calcoli di producibilità sono presenti negli allegati a questa relazione a questa relazione.

11. RISPARMIO DI COMBUSTIBILE

Un utile indicatore per definire il risparmio di combustibile derivante dall'utilizzo di fonti energetiche rinnovabili è il fattore di conversione dell'energia elettrica in energia primaria [TEP/MWh], pari a 0.187 TEP/MWh.

Il T.E.P. (Tonnellate Equivalenti di Petrolio) valutato al primo anno di attività dell'impianto fotovoltaico è pari a 9577.39 decrescendo nel corso degli anni e raggiungendo un valore stimato al ventesimo anno pari a 84130.05, ipotizzando una perdita di efficienza annua del 0.90 %.

I risultati di calcolo sono presenti nei documenti allegati a questa relazione.

12. MODULO FOTOVOLTAICO

I moduli fotovoltaici considerati sono in silicio monocristallino monofacciale da 120 celle e potenza 605W ed efficienza fino a 21.4% con performance lineare garantita 25 anni. I moduli sono provvisti di cornice in alluminio.

Dimensioni: 2172×1303×35 mm, peso 30.9kg.

13. STRUTTURA FOTOVOLTAICA

I moduli fotovoltaici sono montati su strutture monoassiali ad inseguimento solare dette tracker, aventi asse principale posizionato nella direzione Nord-Sud e caratterizzate da un angolo di rotazione pari a +60° e a -60°. Nella configurazione elettrica di progetto si prevede l'installazione di due tipologie di vele fotovoltaiche con orientamento verticale dei moduli (Portrait):

- vela fotovoltaica (2x32) di dimensioni reali 4.35 m x 42.76 m, che consentirà l'installazione di 64 moduli che costituiranno due stringhe;
- vela fotovoltaica (2x16) di dimensioni reali 4.35 m x 21,72 m, che consentirà l'installazione di 32 moduli che costituiranno una sola stringa.

Ogni tracker utilizza dispositivi elettrici, elettromeccanici ed elettronici per seguire il sole nella sua traiettoria da Est verso Ovest.

Relativamente all'impianto è prevista l'installazione di 783 strutture per la tipologia 2x32 e 102 strutture per la tipologia 2x16.

14. CABINE DI IMPIANTO

L'impianto fotovoltaico è composto da 22 Conversion Unit.

Ogni Cabina di campo si compone di:

- Locale inverter contenente i, quadri bt, il trasformatore dei servizi ausiliari e i servizi ausiliari;
- Locale Trasformatore contiene un trasformatore di potenza;
- Locale quadri MT contenente i quadri MT.

Le cabine CU2, 5, 6, 7, 8, 9, 22 da 1995 kW, di dimensioni 8,25m x 2,40m accolgono al loro interno:

- Locale inverter contenente i quadri bt, il trasformatore dei servizi ausiliari e i servizi ausiliari;
- Locale Trasformatore contente un trasformatore di potenza;

- Locale quadri MT contenente i quadri MT.

Le cabine CU12, 13, 16, 17, 19, 20, 21 da 1500 kW, di dimensioni 8.25m x 2,40m accolgono al loro interno:

- Locale inverter contenente i quadri bt, il trasformatore dei servizi ausiliari e i servizi ausiliari;
- Locale Trasformatore contente un trasformatore di potenza;
- Locale quadri MT contenente i quadri MT.

La cabina CU4 da 998 kW, di dimensioni 6,50m x 2,40m accolgono al loro interno:

- Locale inverter contenente i quadri bt, il trasformatore dei servizi ausiliari e i servizi ausiliari;
- Locale Trasformatore contente un trasformatore di potenza;
- Locale quadri MT contenente i quadri MT.

Le cabine CU1, 3, 14, 15 da 500 kW, di dimensioni 6,50m x 2,40m accolgono al loro interno:

- Locale inverter contenente i quadri bt, il trasformatore dei servizi ausiliari e i servizi ausiliari;
- Locale Trasformatore contente un trasformatore di potenza;
- Locale quadri MT contenente i quadri MT.

Le cabine CU10, 11, 18 da 300 kW, di dimensioni 6,50m x 2,40m accolgono al loro interno:

- Locale inverter contenente i quadri bt, il trasformatore dei servizi ausiliari e i servizi ausiliari;
- Locale Trasformatore contente un trasformatore di potenza;
- Locale quadri MT contenente i quadri MT.

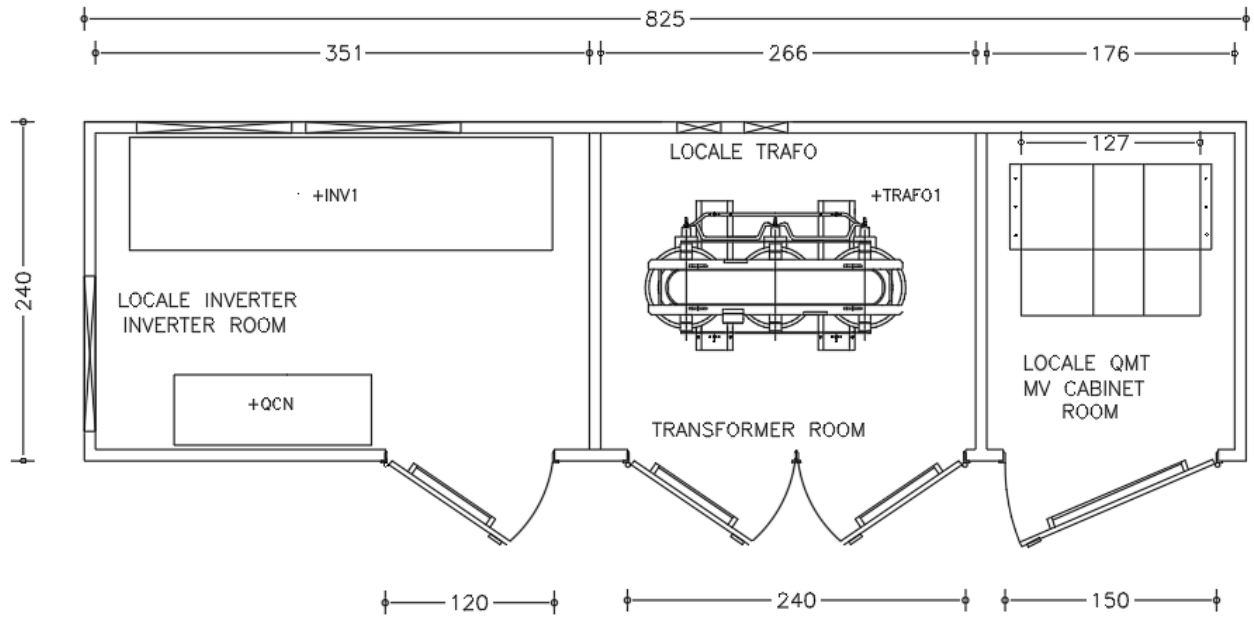

Figura 1: Pianta cabine di campo da 1995kW e 1500kW

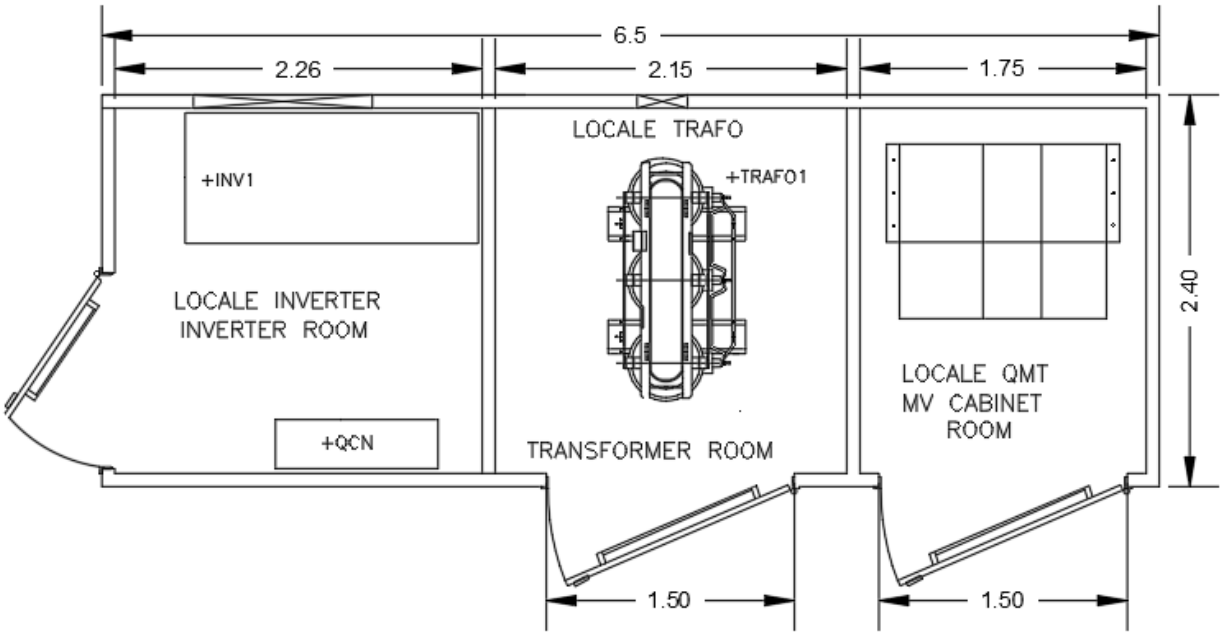

Figura 2: Pianta cabine di campo da 998Kw, 500 kW e 300 kW

L'impianto verrà suddiviso in tre cluster che si collegheranno alla sottostazione di elevazione 150/30 kV. L'assegnazione del cluster di ogni inverter e il suo relativo caricamento è descritto nelle tabelle seguenti:

15. ELETTRODOTTI DI IMPIANTO

Per la completa comprensione dei tracciati dei cavi oltreché delle connessioni interne all'impianto, si sottolinea che i cavi previsti per trasporto dell'energia fino al punto di consegna, avranno alluminio come materiale conduttore e sezioni tali da contenere entro i limiti ammessi le cadute di tensione lungo il percorso.

Si è posta particolare attenzione all'individuazione dei tracciati dei cavi, sia per evitare l'esposizione a nuovi campi elettromagnetici (comunque accettabili nel caso in esame) di fabbricati di frequente accesso, sia per evitare interferenze con zone in dissesto e vincoli territoriali.

Parallelamente ai cavi per il trasporto dell'energia prodotta dall'impianto, viaggeranno i cavi in fibra ottica a servizio del sistema di tele – controllo e di trasmissione dati.

Il tracciato del cavidotto per l'elettrodotto di connessione, segue il percorso individuato dalla viabilità esistente e si sviluppa per una lunghezza massima di 9.23 km circa.

La materia è disciplinata, eccezione fatta per i riempimenti, dalla CEI 11-17. In particolare detta norma stabilisce che l'integrità dei cavi deve essere garantita da una robusta protezione meccanica supplementare, in grado di assorbire, senza danni per il cavo stesso, le sollecitazioni meccaniche, statiche e dinamiche, derivanti dal traffico veicolare (resistenza a schiacciamento) e dagli abituali attrezzi manuali di scavo (resistenza a urto). La profondità minima di posa, con cavidotti in MT, per le strade di uso pubblico è fissata dal Nuovo Codice della Strada ad 1 m dall'estradosso della protezione (tubo); per tutti gli altri suoli e le strade di uso privato valgono i valori stabiliti dalla CEI 11-17 che fissa le profondità minime di:

- 0,6 m (su terreno privato);
- 0,8 m (su terreno pubblico).

Nell'ambito del progetto, i cavi bt di stringa dovranno essere del tipo H1Z2Z2-K. La posa deve essere prevista in canalina metallica ancorata alle strutture di sostegno moduli ove necessario in tubo corrugate interrato.

I cavi bt di collegamento tra gli Sting Box e il quadro di campo QPPI, presente nell'inverter, dovranno essere del tipo ARG70R 0.6/1kV con sezione minima calcolata tenendo conto di una caduta di tensione massima ammissibile <2% (calcolata come la somma della caduta di tensione sul tratto string box – inverter e la caduta d tensione sui cavi di collegamento stringhe – string box).

I cavi MT dovranno essere in alluminio con formazione ad elica visibile del tipo ARE4H5EX 18/30kV di varie sezioni, con posa interrata entro corrugato a quota minima -1.00 m. Il cavo di collegamento con la sottostazione ARE4H5E 18/30kV con sezione minima calcolata tenendo conto di una caduta di tensione massima ammissibile e con posa interrata a -1.00m ÷ -1.20 m entro tubo corrugato di tipo pesante aventi caratteristiche meccaniche DN160.

La presenza dei cavi interrati deve essere rilevabile mediante l'apposito nastro monitore posato a non meno di 0,2 m dall'estradosso del cavo. Le modalità di fissaggio della fune per il traino del cavo, le sollecitazioni massime applicabili e i raggi di curvatura massimi sono stabilite dalla CEI 20-89 art 8.2.4 e dalla CEI 11-17 art 4.3.2. Di norma non sono da prevedere pozzetti o camerette di posa dei cavi in corrispondenza di giunti e deviazioni del tracciato. Dalla CEI 11-17, la profondità minima di posa, per cavidotti in BT, è fissata a 0.5 m dall'estradosso del cavo e la presenza dei cavi deve essere rilevabile mediante l'apposito nastro monitore posato a non meno di 0,2 m dall'estradosso del cavo.

Durante le operazioni di posa dei cavi per installazione fissa le Norme CEI 11-17 all'articolo 2.3.03 prescrivono che i raggi di curvatura misurati sulla generatrice interna dei cavi, non devono mai essere inferiori a:

16 D per cavi sotto guaina in piombo

14 D per cavi con schermatura a fili o nastri o a conduttore concentrico

12 D per cavi senza alcun rivestimento metallico

dove D = diametro esterno

La temperatura minima di posa del cavo in oggetto, nel rispetto delle indicazioni fornite dal costruttore, non è inferiore a 0°C.

La progettazione del cavidotto sotterraneo in bassa e media tensione è improntata a criteri di sicurezza, sia per quanto attiene le modalità di realizzazione sia per quanto concerne la compatibilità in esercizio con le opere interferite. La progettazione è improntata all'ottimizzazione del tracciato di posa in funzione del costo del cavo in opera, tenendo in particolare considerazione la riduzione dei tempi e dei costi di realizzazione. Non risultano noti in questa fase altri servizi esistenti nel sottosuolo, quali: acquedotti, cavi elettrici o telefonici, cavi dati, fognature ecc.

Durante le operazioni di posa del cavo ARE4H5EX e ARE4H5E 18/30kV il raggio di curvatura minimo di posa rispetterà quanto previsto dalle specifiche del produttore.
