## 1. DESCRIZIONE DELL'OPERA

---

La presente relazione di calcolo riguarda il sottopasso scatolare previsto nell'ambito della realizzazione del Sottovia S.C. Vizzolo Picca dell'Autostrada Cispadana.

L'opera la cui sezione in retto misura 9.30x5.90m si sviluppa complessivamente per 37.50m . L'altezza di ricoprimento assunta ai fini del calcolo della struttura è pari a 1.10m.

Le azioni considerate nel calcolo sono quelle tipiche di una struttura interrata con le aggiunte delle azioni di tipo stradale, con applicazione della Normativa sui ponti ferroviari D. M. Min. II. TT. del 14 gennaio 2008 – Norme tecniche per le costruzioni.

L'opera ricade in zona sismica, pertanto, saranno applicate le azioni di rito previste dalla norma, così come riportato nei capitoli successivi.

### 3. DURABILITÀ E PRESCRIZIONI SUI MATERIALI

Per garantire la durabilità delle strutture in calcestruzzo armato ordinario, esposte all'azione dell'ambiente, si devono adottare i provvedimenti atti a limitare gli effetti di degrado indotti dall'attacco chimico, fisico e derivante dalla corrosione delle armature e dai cicli di gelo e disgelo.

Al fine di ottenere la prestazione richiesta in funzione delle condizioni ambientali, nonché per la definizione della relativa classe, si fa riferimento alle indicazioni contenute nelle Linee Guida sul calcestruzzo strutturale edite dal Servizio Tecnico Centrale del Consiglio Superiore dei Lavori Pubblici ovvero alle norme UNI EN 206-1:2006 ed UNI 11104:2004.

Ai fini di preservare le armature dai fenomeni di aggressione ambientale, dovrà essere previsto un idoneo copriferro; il suo valore, misurato tra la parete interna del cassero e la generatrice dell'armatura metallica più vicina, individua il cosiddetto "copriferro nominale".

Il copriferro nominale  $c_{nom}$  è somma di due contributi, il copriferro minimo  $c_{min}$  e la tolleranza di posizionamento  $h$ . Vale pertanto:  $c_{nom} = c_{min} + h$ .

La tolleranza di posizionamento delle armature "h", per le strutture gettate in opera, può essere assunta pari a 5 mm, nell'ipotesi in cui sia previsto controllo di qualità con misura dei copriferri.

In accordo con le specifiche dei materiali da utilizzarsi per l'opera in oggetto, si utilizzano i seguenti tipi di calcestruzzo e copri ferri minimi. Il copriferro è valutato in accordo a quanto prescritto nella Norma UNI EN 1992-1-1, mentre la classe di resistenza minima è definita in accordo al Prospetto 4 della Norma UNI 11104:2004.

In base a quanto definito nel riferimento [2] e in accordo con quanto previsto nelle tabelle 4.2.III e 4.1.IV del D.M. 14 Gennaio 2008 si definiscono le condizioni ambientali ed i relativi limiti di apertura delle fessure accettabili per ciascun elemento strutturale.

## 5. CRITERI DI CALCOLO

---

In ottemperanza con la normativa vigente, i calcoli sono condotti con il metodo semiprobabilistico agli stati limite.

### 5.1. Calcolo delle spinte sui paramenti verticali

---

In generale occorre considerare, di volta in volta, le spinte più appropriate a seconda della deformabilità della parete.

Nel caso di muri per i quali si possano accettare significative deformazioni, è possibile assumere, sia in condizioni statiche sia in condizioni sismiche, un regime di spinte attive. Altrimenti è in genere necessario assumere condizioni di spinta a riposo.

In presenza di sisma, è consentito l'approccio pseudo-statico, secondo il quale il complesso muro + terreno mobilitato è pensato soggetto ad un'accelerazione sismica uniforme avente le seguenti componenti

$$\text{Orizzontale} = k_h g \qquad \text{Verticale} = k_v g = \pm 0.5 k_h g$$

Come nel caso statico, anche in condizioni sismiche è necessario distinguere tra:

- muri indeformabili;
- muri deformabili;
- muri molto deformabili;

Nella prima classe di muri (**muri indeformabili**) possono essere inclusi i manufatti aventi pareti adeguatamente contrastate, quali, ad esempio, gli scatolari. In questo caso è opportuno adottare spinte sismiche secondo la teoria di Wood (1973), come meglio indicato nel §5.1.4.

Nella categoria dei **muri deformabili** si possono includere le pareti sufficientemente deformabili grazie alla loro snellezza ma tuttavia sostanzialmente vincolate, in qualche modo, ad altre strutture, come ad esempio le pareti di manufatti a U. In questo caso potranno essere considerate spinte comprese tra valori a riposo e attive, in ragione della deformabilità. Queste ultime ( sismiche attive) saranno valutate assumendo

(SLV)  $k_h = \beta_m \cdot a_{max}/g$  , con  $\beta_m=1$

Nella categoria dei **muri molto deformabili** per i quali possono essere ipotizzati significativi spostamenti relativi tra muro e terreno, si possono includere, ad esempio, i muri di sostegno fondati su fondazioni dirette. In questo caso si assumeranno certamente spinte attive, da valutarsi, introducendo nel caso sismico un coefficiente  $\beta_m$  in accordo con la Tabella 7.11.II di NTC2008.

(SLV)  $k_h = \beta_m \cdot a_{max}/g$  ( $\beta_m$  da Tab 7.11.II)

in questo caso  $\beta_m = 0.31$ ,

Seguono ora i criteri generali di valutazione delle spinte, applicabili a geometrie ordinarie.

### 5.1.1. Spinte attive in condizioni statiche

Ad una generica profondità  $z$ , nel caso di terreno puramente granulare, lo sforzo orizzontale totale  $\sigma_A(z)$  sulla parete è dato da:

$$\sigma_A(z) = K_A \cdot [\sigma_v(z) - u(z)] + u(z) \quad (5-1)$$

In cui

$\sigma_v(z)$  = sforzo verticale totale alla generica profondità, ossia il peso della colonna di terreno e di acqua soprastante la quota  $z$ .

$u(z)$  = pressione dell'acqua alla generica profondità

Il coefficiente di spinta attiva  $K_A$  può, in genere, essere assunto pari a

$$K_A = \tan^2\left(\frac{\pi}{4} - \frac{\phi}{2}\right) \quad (5-2)$$

È possibile, tuttavia, mettere in conto l'angolo d'attrito  $\delta$  tra terra e muro, assumendo quindi che la spinta sia inclinata, rispetto alla normale alla superficie di contatto tra muro e terreno, di un angolo  $\delta$ .

In questo caso il coefficiente di spinta attiva può essere valutato con le note formule derivate dalla teoria di Coulomb e sviluppate da Muller-Breslau.

CONDIZIONI DI SPINTA ATTIVA – Teoria di Coulomb

$$K_A = \frac{\sin^2(\psi + \phi)}{\sin^2 \psi \sin(\psi - \delta) \left[ 1 + \sqrt{\frac{\sin(\phi + \delta) \sin(\phi - \beta)}{\sin(\psi - \delta) \sin(\psi + \beta)}} \right]^2} \quad (5-3)$$

Operando nell'ambito del metodo agli stati limite, nelle formule precedenti, va introdotto l'angolo d'attrito di calcolo, cioè  $\tan(\phi_d) = \tan(\phi_k) / \gamma_\phi$  se si opera nell'ambito di una combinazione GEO (ad esempio A2+M2+R2).

### 5.1.2. Spinte a riposo

Ad una generica profondità  $z$ , nel caso di terreno puramente granulare, lo sforzo orizzontale totale  $\sigma_0(z)$  sulla parete è dato da:

$$\sigma_0(z) = K_0 \cdot [\sigma_v(z) - u(z)] + u(z) \quad (5-4)$$

In cui, nel caso di piano campagna orizzontale, il coefficiente di spinta a riposo  $K_0$  se non diversamente definito, può essere assunto pari a

$$K_0 = (1 - \sin(\phi)) \cdot \sqrt{OCR} \quad (5-5)$$

Con  $OCR = GSC =$  grado di sovraconsolidazione.

### 5.1.3. Spinte attive in condizioni sismiche

Nell'ambito dell'approccio pseudo-statico, il complesso muro + terreno mobilitato è pensato soggetto ad un'accelerazione sismica uniforme avente le seguenti componenti

Orizzontale =  $k_h \cdot g$                       Verticale =  $k_v \cdot g$

La spinta totale attiva su un paramento di altezza pari ad H è data da:

$$E_d = \frac{1}{2} \gamma^* (1 \pm k_v) K_{A,E} H^2 + E_{ws} + E_{wd} \quad (5-6)$$

Il primo termine è la spinta attiva dovuta allo scheletro solido, il secondo termine  $E_{ws}$  è la risultante delle pressioni idrostatiche ed il terzo  $E_{wd}$  è la risultante delle sovrappressioni interstiziali.

I coefficienti di spinta attiva sono dati dalle seguenti espressioni (Mononobe & Okabe, nel seguito M-O):

**CONDIZIONI DI SPINTA ATTIVA – Teoria di M-O**

$\beta \leq \phi - \theta$ :  $K_{A,E} = \frac{\text{sen}^2(\psi + \phi - \theta)}{\cos \theta \text{sen}^2 \psi \text{sen}(\psi - \theta - \delta) \left[ 1 + \sqrt{\frac{\text{sen}(\phi + \delta) \text{sen}(\phi - \beta - \theta)}{\text{sen}(\psi - \theta - \delta) \text{sen}(\psi + \beta)}} \right]^2}$

$\beta > \phi - \theta$ :  $K_{A,E} = \frac{\text{sen}^2(\psi + \phi - \theta)}{\cos \theta \text{sen}^2 \psi \text{sen}(\psi - \theta - \delta)}$

The diagram shows a retaining wall cross-section. The wall face is vertical, and the backfill is inclined at an angle  $\beta$  to the horizontal. The failure surface is inclined at an angle  $\psi$  to the horizontal. The angle between the failure surface and the wall face is  $\delta$ . Horizontal seismic coefficient  $k_h$  and vertical seismic coefficient  $k_v$  are indicated.

(5-7)

Operando nell'ambito del metodo agli stati limite, nelle formule precedenti, va introdotto l'angolo d'attrito di calcolo, cioè  $\tan(\phi_d) = \tan(\phi_k) / \gamma_\phi$  se si opera nell'ambito di una combinazione GEO (ad esempio A2+M2+R2).

A seconda della definizione del peso specifico  $\gamma^*$  del cuneo e dell'angolo  $\theta$  definito come l'angolo, rispetto alla verticale, fra le azioni esterne orizzontali e quelle verticali agenti sul cuneo di spinta di volume V, l'espressione generale può essere utilizzata per tre diverse condizioni nelle quali può trovarsi il rilevato.

### 5.1.3.1 Rilevato asciutto

Non c'è alcuna azione dovuta all'acqua: corrisponde alla configurazione originale ipotizzata da M-O. Come peso specifico  $\gamma^*$  si deve assumere il peso secco  $\gamma_d$ ; la forza orizzontale  $F_h$  è pari alla massa del terreno moltiplicata per l'accelerazione orizzontale mentre la forza verticale  $F_v$  è il peso del cuneo incrementato o decrementato dall'accelerazione sismica verticale; quindi:

$$\gamma^* = \gamma_d$$

$$\tan \theta = \frac{k_h}{1 \pm k_v}$$

$$E_{ws} = E_{wd} = 0$$

### 5.1.3.2 Rilevato saturo a grana fine (dinamicamente impervio: $k < 5 \cdot 10^{-4}$ m/s)

In sostanza si assume che l'acqua, imprigionata negli interstizi, si muova insieme con il terreno: l'accelerazione sismica agirà quindi sulla massa complessiva (terreno+acqua) del cuneo, pari a  $V \cdot \gamma_{sat}$ . Si ammette che le pressioni interstiziali non subiscano variazioni ai fini del calcolo delle azioni sulla parete. In questo caso l'equilibrio limite del cuneo è fatto al netto della risultante delle azioni idrostatiche e quindi, nelle formule generali, si assumerà:

$$\gamma^* = \gamma'$$

$$\tan \theta = \frac{\gamma_{sat}}{\gamma'} \frac{k_h}{1 \pm k_v}$$

Alla spinta efficace dovrà essere aggiunta la spinta idrostatica dell'acqua, mentre, per ipotesi, la componente idrodinamica non può svilupparsi. Quindi:

$$E_{ws} = \frac{1}{2} \gamma_w H^2$$

$$E_{wd} = 0$$

### 5.1.3.3 Rilevato saturo a grana grossa (dinamicamente permeabile: $k \geq 5 \cdot 10^{-4}$ m/s)

Si ammette che l'acqua negli interstizi possa muoversi liberamente, indipendentemente dalle deformazioni subite dal terreno: l'accelerazione sismica agirà quindi sulla massa della sola parte solida del cuneo, pari a

$V \cdot \gamma_d$ . L'equilibrio limite del cuneo è fatto al netto della risultante delle pressioni interstiziali e quindi, nelle formule generali, si assumerà:

$$\gamma^* = \gamma'$$

$$\tan \theta = \frac{\gamma_d}{\gamma'} \frac{k_h}{1 \pm k_v}$$

In questo caso dovranno essere aggiunte sia la spinta idrostatica sia la sovrappinta idrodinamica della stessa acqua di falda.

$$E_{ws} = \frac{1}{2} \gamma_w H^2$$

$$E_{wd} = \frac{7}{12} k_h \gamma_w H'^2 \quad \text{con } H' = \text{altezza della freatica dal piede del muro.}$$

#### 5.1.3.4 Punto di applicazione delle spinte attive sismiche

Considerato che la spinta attiva complessiva è in generale composta da tre termini, occorre calcolare il punto di applicazione di ognuno di essi

1. **Componente associata allo scheletro solido:** è possibile operare come segue

- a) si calcola la spinta attiva in condizioni statiche ( $S_{A,S}$ )
- b) si calcola la quota parte efficace di spinta sismica  $E_d$  dovuta alla terra:

$$S_{A,E} = \frac{1}{2} \gamma^* (1 \pm k_v) K_{A,E} H^2$$

Nel caso di terreno eterogeneo, la spinta attiva è calcolata considerando la variabilità di  $K_{A,sismico}$ . Nel caso di terreno omogeneo ma parzialmente in falda, si suggerisce di adottare l'approccio sopra indicato, piuttosto che introdurre diversi valori dei coefficienti di spinta.

- c) si calcola l'incremento di spinta dovuto alla terra in caso di sisma (componente efficace):

$$\Delta S_A = S_{A,E} - S_{A,S}$$

- d) Nel caso di muri che possano ruotare alla base, si può considerare che tale incremento abbia una risultante nello stesso punto della risultante delle spinte statiche
- e) Negli altri casi si può assumere che tale azione si distribuisca uniformemente sulla parete, il che equivale ad applicare un carico uniformemente distribuito pari a:

$$q = \Delta S_A / H$$

2. **Componente idrostatica:** è applicata come nel caso statico

3. **Componente idrodinamica ( $E_{wd}$ ):** se esiste, è applicata considerando la seguente distribuzione di pressioni:

$$q_{wd}(z) = \pm \frac{7}{8} k_h \gamma_w \sqrt{H' \cdot z} \quad \text{con } z \text{ quota del generico punto rispetto la base della parete.}$$

#### 5.1.4. Sovrappinte sismiche su muri non in grado di spostarsi

In questo caso l'utilizzo delle equazioni di M-O non è raccomandato. Le spinte delle terre, sono calcolate in regime di spinta a riposo che comporta il calcolo delle spinte sismiche in tali condizioni; l'incremento dinamico di spinta del terreno può essere quindi calcolato attraverso la nota formulazione di Wood (1973) come:

$$\Delta P_d = S \cdot a_g / g \cdot \gamma \cdot h_{tot}^2 = a_{max} / g \cdot \gamma \cdot h_{tot}^2$$

Con  $h_{tot}$  = altezza del muro.

Questa spinta è applicata come una distribuzione uniforme lungo l'altezza  $h_{tot}$ .

Il punto di applicazione della spinta che interessa lo scatolare è posto  $h_{scat}/2$ , con " $h_{tot}$ " altezza dalla fondazione dello scatolare al piano stradale e  $h_{scat}$  l'altezza dello scatolare.

Essendo " $\Delta P_d$ " la risultante globale, ed il diagramma di spinta di tipo rettangolare, è immediato ricavare la quota parte della spinta che agisce sul piedritto dello scatolare.

L'azione sismica è rappresentata da un insieme di forze statiche orizzontali e verticali, date dal prodotto delle forze di gravità per i coefficienti sismici in precedenza definiti, di cui la componente verticale è considerata agente verso l'alto o verso il basso, in modo da produrre gli effetti più sfavorevoli.

FIGURA 5-1 ALTEZZE DI RIFERIMENTO PER IL CALCOLO DELL'AZIONE SISMICA

5.1.4.1 Rilevato parzialmente immerso

FIGURA 5-2: TERRAPIENO PARZIALMENTE IMMERSO.

Ebeling e Morrison (1992) indicano il modo per utilizzare, anche in questo caso, le equazioni di M-O: sostanzialmente questo caso può essere assimilato a quello di un terrapieno completamente immerso omogeneo, avente un peso specifico equivalente. Per calcolare la risultante delle spinte, si potrà operare come segue. Si definiscono i pesi specifici medi da associare rispettivamente alla componente efficace verticale ed alla componente laterale

$$\gamma_v^* = \left(\frac{h_w}{h}\right)^2 \cdot \gamma' + \left[1 - \left(\frac{h_w}{h}\right)^2\right] \cdot \gamma_d$$

$$\gamma_H^* = \begin{cases} \gamma_d & \text{se terreno din. permeabile} \\ \left(\frac{h_w}{h}\right)^2 \cdot \gamma_{sat} + \left[1 - \left(\frac{h_w}{h}\right)^2\right] \cdot \gamma_d & \text{se terreno din. impervio} \end{cases}$$

Definendo

$$\tan \theta = \frac{\gamma_H^* \cdot k_h}{\gamma_v^* \cdot 1 - k_v}$$

si applicherà poi la (5-6) calcolando i coefficienti di spinta tramite le (5-7) e ponendo  $\gamma^* = \gamma_v^*$ .

5.1.4.2 Punto di applicazione delle spinte attive sismiche

Considerato che la spinta attiva complessiva è in generale composta da tre termini, occorre calcolare il punto di applicazione di ognuno di essi

4. **Componente associata allo scheletro solido:** è possibile operare come segue

f) si calcola la spinta attiva in condizioni statiche ( $S_{A,S}$ )

g) si calcola la quota parte efficace di spinta sismica  $E_d$  dovuta alla terra:

$$S_{A,E} = \frac{1}{2} \gamma^* (1 \pm k_v) K_{A,E} H^2$$

Nel caso di terreno eterogeneo, la spinta attiva è calcolata considerando la variabilità di  $K_{A,sismico}$ . Nel caso di terreno omogeneo ma parzialmente in falda, si suggerisce di adottare l'approccio sopra indicato, piuttosto che introdurre diversi valori dei coefficienti di spinta.

h) si calcola l'incremento di spinta dovuto alla terra in caso di sisma (componente efficace):

$$\Delta S_A = S_{A,E} - S_{A,S}$$

i) Nel caso di muri che possano ruotare alla base, si può considerare che tale incremento abbia una risultante nello stesso punto della risultante delle spinte statiche

j) Negli altri casi si può assumere che tale azione si distribuisca uniformemente sulla parete, il che equivale ad applicare un carico uniformemente distribuito pari a:

$$q = \Delta S_A / H$$

5. **Componente idrostatica:** è applicata come nel caso statico

6. **Componente idrodinamica ( $E_{wd}$ ):** se esiste, è applicata considerando la seguente distribuzione di pressioni:

$$q_{wd}(z) = \pm \frac{7}{8} k_h \gamma_w \sqrt{H \cdot z} \quad \text{con } z \text{ quota del generico punto rispetto la base della parete.}$$

### 5.1.5. Sovraspinte sismiche su muri non in grado di spostarsi

In questo caso l'utilizzo delle equazioni di M-O non è raccomandato. $$\Delta P_d = S \cdot a_g / g \cdot \gamma \cdot h_{tot}^2 = a_{max} / g \cdot \gamma \cdot h_{tot}^2$$

Con  $h_{tot}$  = altezza del muro.

Questa spinta è applicata come una distribuzione uniforme lungo l'altezza  $h_{tot}$ .

Nel caso di scatolare, si assumerà  $\gamma = 19.5 \text{ kN/m}^3$  = peso di volume del materiale compattato del rilevato.

Il punto di applicazione della spinta che interessa lo scatolare è posto  $h_{scat}/2$ , con " $h_{tot}$ " altezza dalla fondazione dello scatolare al piano stradale e  $h_{scat}$  l'altezza dello scatolare.

**FIGURA 5-3 ALTEZZE DI RIFERIMENTO PER IL CALCOLO DELL'AZIONE SISMICA**

## 5.2. Criteri e definizione dell'azione sismica

L'effetto dell'azione sismica di progetto sull'opera nel suo complesso, includendo il volume significativo di terreno, la struttura di fondazione, gli elementi strutturali e non strutturali, nonché gli impianti, deve rispettare gli stati limite ultimi e di esercizio definiti al § 3.2.1, i cui requisiti di sicurezza sono indicati nel § 7.1 della norma.

Il rispetto degli stati limite si considera conseguito quando:

nei confronti degli stati limite di esercizio siano rispettate le verifiche relative al solo Stato Limite di Danno;

nei confronti degli stati limite ultimi siano rispettate le indicazioni progettuali e costruttive riportate nel § 7 e siano soddisfatte le verifiche relative al solo Stato Limite di salvaguardia della Vita.

Per Stato Limite di Danno (SLD) s'intende che l'opera, nel suo complesso, a seguito del terremoto, includendo gli elementi strutturali, quelli non strutturali, le apparecchiature rilevanti alla sua funzione, subisce danni tali da non provocare rischi agli utenti e non compromette significativamente la capacità di resistenza e di rigidità nei confronti delle azioni verticali e orizzontali. Lo stato limite di esercizio comporta la verifica delle tensioni di lavoro, in conformità al § 4.1.2.2.5 (NT).

Per Stato Limite di salvaguardia della Vita (SLV) si intende che l'opera a seguito del terremoto subisce rotture e crolli dei componenti non strutturali e impiantistici e significativi danni di componenti strutturali, cui si associa una perdita significativa di rigidità nei confronti delle azioni orizzontali (creazione di cerniere plastiche secondo il criterio della gerarchia delle resistenze), mantenendo ancora un margine di sicurezza (resistenza e rigidità) nei confronti delle azioni verticali.

Gli stati limite, sia di esercizio sia ultimi, sono individuati riferendosi alle prestazioni che l'opera a realizzarsi deve assolvere durante un evento sismico; per la funzione che l'opera deve espletare nella sua vita utile, è significativo calcolare lo Stato Limite di Danno (SLD) per l'esercizio e lo Stato Limite di Salvaguardia della Vita (SLV) per lo stato limite ultimo.

In merito alle opere scatolari di cui trattasi, nel rispetto del punto § 7.9.2., assimilando l'opera scatolare alla categoria delle spalle da ponte, rientrando tra le opere che si muovono con il terreno (§ 7.9.2.1), si può ritenere che la struttura debba mantenere sotto l'azione sismica un comportamento elastico; queste categorie di opere che si muovono con il terreno non subiscono le amplificazioni dell'accelerazione del suolo.

Le azioni sismiche sono valutate in relazione al periodo di riferimento della struttura, che si ricava moltiplicandone la vita nominale  $V_N$  per il coefficiente d'uso  $C_U$

$$V_R = V_N \cdot C_U$$

Il valore del coefficiente d'uso  $C_U$  è definito, al variare della classe d'uso, come mostrato nella tabella seguente:

| CLASSE D'USO       | I   | II  | III | IV  |
|--------------------|-----|-----|-----|-----|
| COEFFICIENTE $C_U$ | 0,7 | 1,0 | 1,5 | 2,0 |

TABELLA 5.1 VALORI DEL COEFFICIENTE D'USO  $C_U$

Il valore di probabilità di superamento del periodo di riferimento  $P_{VR}$ , cui riferirsi per individuare l'azione sismica agente, è:

$$P_{VR}(SLV) = 10\%$$

Il **periodo di ritorno** dell'azione sismica  $T_R$  espresso in anni vale:

$$T_R(SLV) = - \frac{V_r}{\ln(1 - P_{vr})}$$

**TABELLA 5.2 PERIODO DI RITORNO PER L'AZIONE SISMICA**

Dato il valore del periodo di ritorno suddetto, tramite le tabelle riportate nell'Allegato B della norma o tramite la mappatura messa a disposizione in rete dall'Istituto Nazionale di Geofisica e Vulcanologia (INGV), è possibile definire i valori di  $a_g$ ,  $F_0$ ,  $T_c^*$ .

$a_g$  → accelerazione massima al sito;

$F_0$  → valore massimo del fattore di amplificazione dello spettro in accelerazione orizzontale;

$T_c^*$  → periodo di inizio del tratto a velocità costante dello spettro in accelerazione orizzontale;

$S$  → coefficiente che comprende l'effetto dell'amplificazione stratigrafica ( $S_s$ ) e dell'amplificazione topografica ( $S_t$ ).

L'opera in oggetto ricade nelle vicinanze del comune di Mirandola di cui si riportano le caratteristiche sismiche in funzione del periodo di ritorno del sisma definito nella tabella precedente :

| Periodo di ritorno SLV [anni] | $a_g/g$ | $F_0$ | $T_c^*$ (s) | Categoria sottosuolo | $S_s$ | $a_{max}/g$ |
|-------------------------------|---------|-------|-------------|----------------------|-------|-------------|
| 1898                          | 0.253   | 2.467 | 0.285       | c                    | 1.33  | 0.335       |

Il calcolo viene eseguito con il metodo pseudostatico (§ 7.11.6 NT). In queste condizioni l'azione sismica è rappresentata da una forza statica equivalente pari al prodotto delle forze di gravità per un opportuno coefficiente sismico.

### 5.3. Combinazioni di carico

Le combinazioni di carico, utilizzate per condurre le verifiche agli stati limite ultimi e agli stati limite di esercizio, sono state originate in ottemperanza con quanto prescritto dalla vigente normativa.

#### 5.3.1. Combinazioni per la verifica allo SLU

Gli stati limite ultimi delle opere interrato si riferiscono allo sviluppo di meccanismi di collasso, determinati dalla mobilitazione della resistenza del terreno, e al raggiungimento della resistenza degli elementi strutturali che compongono l'opera.

Le verifiche agli stati limite ultimi sono eseguiti in riferimento ai seguenti stati limite:

-SLU di tipo geotecnico (GEO) e di equilibrio di corpo rigido (EQU)

collasso per carico limite dell'insieme fondazione-terreno;

-SLU di tipo strutturale (STR)

raggiungimento della resistenza negli elementi strutturali.

Trattandosi di opere interrato, le verifiche saranno condotte secondo l'approccio progettuale “Approccio 1”, utilizzando i coefficienti parziali riportati nelle Tabelle 6.2.I e 5.1.V per i parametri geotecnici e le azioni.

combinazione 1 → (A1+M1+R1) ⇒ STR (verifiche degli elementi strutturali)

combinazione 2 → (A2+M2+R2) ⇒ GEO (carico limite)

### 5.3.2. Combinazioni per la verifica allo SLE

Ai fini delle verifiche degli stati limite di esercizio (fessurazione/ stato tensionale) si definiscono le seguenti combinazioni:

$$\text{Frequente)} \quad \Rightarrow \quad G_1 + G_2 + \psi_{11} \cdot Q_{k1} + \sum_i \psi_{2i} \cdot Q_{ki} \quad \Rightarrow (\Phi_d' = \Phi_k')$$

$$\text{Rara)} \quad \Rightarrow \quad G_1 + G_2 + Q_{k1} + \sum_i \psi_{0i} \cdot Q_{ki} \quad \Rightarrow (\Phi_d' = \Phi_k')$$

I valori dei coefficienti di combinazione sono dedotti dalla tabella 5.1.Vi del D.M. 14 Gennaio 2008.

### 5.3.3. Combinazioni per la condizione sismica

Per la condizione sismica, le combinazioni per gli stati limite ultimi da prendere in considerazione sono le seguenti (approccio 1):

$$\text{STR}) \Rightarrow E+G_1+G_2+\sum_i \psi_{2i} \cdot Q_{ki} \Rightarrow (\Phi_d' = \Phi_k')$$

$$\text{GEO}) \Rightarrow E+G_1+G_2+\sum_i \psi_{2i} \cdot Q_{ki} \Rightarrow (\text{spinte } \Phi_d' = \tan^{-1}(\tan \Phi_k' / \gamma_\phi))$$

Gli effetti dell'azione sismica saranno valutati tenendo conto delle masse associate ai seguenti carichi gravitazionali:

$$G_1+G_2+\sum_i \psi_{2i} \cdot Q_{ki}$$

## 6. PARAMETRI GEOTECNICI

---

Ai fini del calcolo della spinta esercitata dalle terre sui piedritti e del carico da ricoprimento sulla soletta superiore del **manufatto scatolare** si utilizzano i parametri seguenti, in accordo con quanto riportato nella Relazione Geotecnica di cui al rif. [3]:

- angolo di attrito interno del terreno  $\Phi = 38^\circ$
- coefficiente di spinta a riposo  $k_0 = 0.384$  (stato limite STR)
- coefficiente di spinta attiva  $k_a = 0.238$  (stato limite STR)
- coefficiente di spinta a riposo, combinazione M2  $k_{0,M2} = 0.47$  (stato limite GEO)
- coefficiente di spinta attiva, combinazione M2  $k_{a,M2} = 0.31$  (stato limite GEO)
- peso specifico del terreno asciutto  $\gamma_{dry} = 19.5$  [kN/m<sup>3</sup>]
- coefficiente di sottofondazione  $k_s = 5000$  [kN/m<sup>3</sup>]

Si assume inoltre, ai fini del calcolo dei carichi permanenti, un peso specifico per la piattaforma stradale pari a  $\gamma_{pav} = 22$  kN/m<sup>3</sup>.

### **7.1.1. Pro Sap**

Il calcolo della struttura viene condotto con il programma PRO\_SAP (prodotto dalla 2S.I. Software e Servizi per l'Ingegneria S.r.l. P.tta Schiatti 8/b 44100 Ferrara)

Gli elementi utilizzati per la modellazione dello schema statico della struttura sono i seguenti:

- Elemento tipo BEAM (trave)
- Elemento tipo BOUNDARY (molla)
- Elemento tipo STIFFNESS (matrice di rigidezza)

Il codice di calcolo adottato e' ALGOR SUPERSAP prodotto dalla ALGOR INTERACTIVE SYSTEMS, Inc. Pittsburgh, PA, USA.

Il programma SUPERSAP applica il metodo degli elementi finiti a strutture di forma qualunque, diversamente caricate e vincolate, nell' ambito del comportamento lineare delle stesse.

Si sottolinea che il solutore ALGOR SUPERSAP e' stato sottoposto, con esito positivo e relativa certificazione, ai test NAFEMS (test di confronto della National Agency for Finite Element Methods and Standards in Inghilterra).

Inoltre, il solutore ALGOR SUPERSAP e' soggetto ad attivita' di controllo ai sensi della QA (quality assurance), condizione essenziale per l' utilizzo dei codici di calcolo nell' ambito della progettazione nucleare ed off-shore.

### **7.1.2. Modellazione adottata**

La struttura viene schematizzata attraverso un modello analitico agli elementi finiti. Si è assunto lo schema statico di telaio chiuso. La mesh è composta da 16 beam elements e da 16 nodi (figure 2a e 2b); l'output di calcolo viene raccolto nell'allegato.

L'analisi strutturale e' condotta con il metodo degli spostamenti per la valutazione dello stato tenso-deformativo indotto da carichi statici.

Il suolo viene modellato facendo ricorso all'usuale artificio delle molle elastiche alla Winkler.

Nel caso in esame il valore della costante di sottofondo si assume pari a:

$$K_s = 5000 \text{ kN/m}^3$$

Agli effetti delle caratteristiche geometriche delle varie aste si è quindi assunto:

- una sezione rettangolare  $b \times h = 100 \times S_s$  cm per la soletta superiore
- una sezione rettangolare  $b \times h = 100 \times S_f$  cm per la soletta di fondazione
- una sezione rettangolare  $b \times h = 100 \times S_p$  cm per i piedritti

Per le aste del reticolo si è assunto:

$E_c = 31477 / 32308 \text{ N/mm}^2$  ; modulo elastico del calcestruzzo rispettivamente per classe di resistenza C25/30 e C28/35.

Lo schema statico della struttura e la relativa numerazione dei nodi e delle aste sono riportati nelle figure seguenti:

**FIG. 2A - NUMERAZIONE DEI NODI**

### 7.2.2. Spinta delle terre

Il reinterro a ridosso dello scatolare verrà realizzato tramite materiale di buone caratteristiche meccaniche, in accordo a quanto riportato al paragrafo 5 del presente documento.

La spinta del terreno assume un andamento lineare con la profondità secondo la legge:

$$p_h = \lambda \gamma_t z$$

dove si considera come coefficiente di spinta  $\lambda$  il coefficiente di spinta attiva o a riposo a seconda dell'elemento strutturale di cui si vogliono massimizzare le sollecitazioni

Le pressioni del terreno relative alla spinta a riposo, in corrispondenza dei nodi caratteristici dei piedritti, risultano essere le seguenti:

$$p_2 = ( 22 * 0.40 + 20 * 0.70 ) * 0.384 = 12.50 \quad \text{kN/m}^2$$

$$p_{12} = p_2 + ( 19.50 * 0.5 ) * 0.384 = 16.24 \quad \text{kN/m}^2$$

$$p_{11} = P_{12} + ( 19.50 * -0.55 ) * 0.384 = 60.42 \quad \text{kN/m}^2$$

$$p_1 = p_{11} + ( 19.50 * 0.55 ) * 0.384 = 64.54 \quad \text{kN/m}^2$$

Tali spinte vengono considerate nella Condizione Elementare (CDC 3) sul piedritto sx e nella Condizione Elementare (CDC 4) sul piedritto dx.

Le pressioni del terreno relative alla spinta attiva, in corrispondenza dei nodi caratteristici dei piedritti, risultano essere le seguenti:

$$\begin{aligned}
 p_2 &= ( 22 * 0.40 + 20 * 0.70 ) * 0.238 &= 5.74 & \text{ kN/m}^2 \\
 p_{12} &= p_2 + ( 19.50 * 0.5 ) * 0.238 &= 7.46 & \text{ kN/m}^2 \\
 p_{11} &= P_{12} + ( 19.50 * -0.55 ) * 0.238 &= 27.74 & \text{ kN/m}^2 \\
 p_1 &= p_{11} + ( 19.50 * 0.55 ) * 0.238 &= 29.63 & \text{ kN/m}^2
 \end{aligned}$$

Tali spinte vengono considerate nella Condizione Elementare (CDC 5) sul piedritto sx e nella Condizione Elementare (CDC 6) sul piedritto dx.

Nelle combinazioni di carico verranno considerate:

- 1) Spinta a riposo su entrambi i piedritti;
- 2) Spinta attiva su ambo i piedritti;
- 3) Spinta a riposo su piedritto sx e spinta attiva su piedritto dx;

La condizione di spinta 3) serve a mettere in conto possibili situazioni (anche temporanee) di disomogeneità nei costipamenti o altre condizioni che possano generare situazioni di spinte asimmetriche sull'opera. La condizione di spinta attiva, sebbene poco realistica considerando le caratteristiche dell'opera, viene comunque considerata a favore di sicurezza per massimizzare i valori delle sollecitazioni flessionali in corrispondenza delle mezzerie delle solette.

Naturalmente queste spinte saranno opportunamente combinate, utilizzando i valori dei coefficienti parziali delle azioni da assumere nell'analisi per la determinazione degli effetti delle azioni nelle verifiche agli stati limite ultimi.

### **7.2.3. Spinta della falda interna allo scatolare**

Assente

(Condizione Elementare CDC 7)

### **7.2.4. Carichi veicolari sulla soletta superiore**

I casi di carico CDC8, CDC9, CDC10 e CDC11 sono relativi agli effetti indotti sulla soletta superiore dai carichi veicolari agenti in corrispondenza della sovrastruttura stradale. I carichi di riferimento sono descritti nel paragrafo 5.1.3.3 del D.M. 14/01/2008.

In particolare lo schema di carico 1 è costituito da carichi concentrati su due assi in tandem e da carichi uniformemente distribuiti ; i carichi concentrati sono pari a:

$Q_{1k} = 300 \text{ kN}$  ad asse ( $300 + 300 = 600 \text{ kN}$ ) su corsia n.1 di larghezza convenzionale pari a 3 m ;

$Q_{2k} = 200 \text{ kN}$  ad asse ( $200 + 200 = 400 \text{ kN}$ ) su corsia n.2 di larghezza convenzionale pari a 3 m ;

$Q_{3k} = 100 \text{ kN}$  ad asse ( $100 + 100 = 200 \text{ kN}$ ) su corsia n.3 di larghezza convenzionale pari a 3 m ;

Si ipotizza che tali carichi siano applicati su un'impronta rettangolare pari a 2.4 x 1.60 m (1.6 m sviluppo parallelo alla corsia di traffico, 2.4 m sviluppo perpendicolare), ovvero pari all'ingombro complessivo esterno del tandem. Per quanto riguarda i carichi uniformemente distribuiti (associati ai carichi tandem) si considera prudenzialmente il carico  $q_{1k} = 9 \text{ kN/m}^2$  applicato a tutte le colonne di carico (la norma prevede l'applicazione dalla seconda alla n-esima corsia di un carico ridotto da  $2.5 \text{ kN/m}^2$ ).

I carichi tandem vengono posizionati ortogonalmente all'asse del sottovia e vengono ripartiti sia in direzione longitudinale che trasversale dal piano stradale al piano medio della soletta superiore. Si assume che la diffusione avvenga con un angolo di  $30^\circ$  attraverso il rilevato stradale (in accordo al punto C5.1.3.3.7.1 della circolare ministeriale del 02/02/2009) e con un angolo di  $45^\circ$  nella soletta superiore del tombino. L'effetto dei carichi tandem sulla soletta superiore viene pertanto messo in conto attraverso la determinazione di un carico equivalente distribuito  $q_{eq}$  a cui si somma il carico uniforme  $q_{1k} = 9 \text{ kN/m}^2$ .

Ai fini del calcolo della ripartizione dei carichi accidentali si assume cautelativamente un'altezza di ricoprimento  $H_r = 0.65 \text{ m}$ .

#### Diffusione del carico tandem in direzione longitudinale (parallela all'asse stradale)

La larghezza di diffusione del carico tandem in direzione longitudinale è pari a:

$$L_{dl} = 1.6 \text{ m} + 2x [\tan 30^\circ \times H_r + \tan 45^\circ \times S_s/2]$$

Nel caso in esame risulta:

$$L_{dl} = 1.60 + 2 * ( 0.65 * \text{tg}30^\circ + 0.50 ) = \mathbf{3.35} \text{ m}$$

#### Diffusione del carico tandem in direzione trasversale (ortogonale all'asse stradale)

In direzione trasversale alla strada detta  $L_{dt}$  la *larghezza di diffusione del carico trasversale* dal piano stradale alla quota del piano medio della soletta superiore, assumendo che detta diffusione avvenga con angolo di diffusione di  $30^\circ$  attraverso il rilevato stradale e di  $45^\circ$  sino al piano medio della soletta superiore

risulta:

$$L_{dt} = 2.40 + 2 \cdot ( 0.65 \cdot \text{tg}30^\circ + 0.50 ) = 4.70 \quad \text{m}$$

Il valore di  $L_{dt}$  viene poi limitato in base alle seguenti circostanze:

presenza della seconda colonna di carico: il carico della 1° colonna, in corrispondenza dell'adiacenza alla 2° colonna, può essere diffuso al massimo fino a 0.30m all'esterno dell'impronta del carico;

posizionando il carico in adiacenza al cordolo, ne consegue che la massima diffusione lato cordolo è pari a:

$$L_{d, \text{cordolo}} = \text{tan}30 \times H_r + \text{tan}45 \times S_s/2$$

pertanto la larghezza di diffusione trasversale non può risultare superiore al valore di:

$$L_{dt,max} = 2.40 + 0.30 + ( 0.65 * \operatorname{tg}30^\circ + 0.50 ) = \mathbf{3.58} \quad \text{m}$$

#### Calcolo del carico distribuito equivalente al tandem

Avendo definito  $L_{dl}$  e  $L_{dt}$  si può valutare l'intensità del carico  $q_{eq}$  equivalente all'effetto indotto dai carichi tandem sulla soletta superiore:

Considerando il carico tandem dovuto alla prima colonna di carico

$$q_{eq} = 2 \times Q_{1k} / ( L_{dl} \times L_{dt,max} ) = \mathbf{50.09 \text{ kN/m}}$$

cui si sovrappone il carico  $q = 9 \text{ kN/m}$  uniforme su tutta la soletta (corrispondente al carico  $q_{1k}$ ).

La posizione del carico  $q_{eq}$  equivalente al tandem viene variata su tutta la soletta nei casi di carico CDC8-10 per massimizzare:

CDC 8: il momento in mezzera soletta;

CDC 9: il taglio nella soletta a filo piedritto destro;

CDC 10: il taglio nella soletta a filo piedritto sinistro.

Si noti che se  $L_{dl} > L + 2 \times S_p$  (larghezza netta interna + spessore dei piedritti) allora il carico equivalente è applicato a tutte le aste della soletta superiore nei tre casi di carico CDC 8-10 che vengono a coincidere tra di loro.

CDC11: sovraccarico uniforme da  $20\text{kN/m}^2$

Si ipotizza che la soletta superiore sia gravata da un carico accidentale uniformemente distribuito di intensità pari a  $20\text{ kN/m}^2$  (scenario da traffico da utilizzarsi in alternativa ai casi di carico 8, 9 e 10).

### 7.2.5. Spinte sui piedritti indotte dai sovraccarichi accidentali

In accordo con il punto C5.1.3.3.7.1 della circolare ministeriale 02/02/2009 per il calcolo delle spinte generate dal sovraccarico sul rilevato si può considerare applicato lo schema di carico 1, in cui per semplicità i carichi tandem possono essere sostituiti da carichi uniformemente distribuiti equivalenti, applicati su una superficie rettangolare larga 3.0 m e lunga 2.20 m. Anche in questo caso si tiene in conto la diffusione del carico attraverso il rilevato sia in direzione longitudinale che trasversale. Al tandem si somma il carico uniformemente distribuito agente sulla i-esima corsia di carico  $q_{ik} = 9 \text{ kN/m}^2$ .

#### Diffusione del carico tandem in direzione longitudinale (parallela all'asse stradale)

Il carico tandem trasformato in carico uniformemente distribuito assume il valore:

$$600/(3.00 \times 2.20) = 90.91 \text{ kN/m}^2$$

La larghezza di diffusione del carico tandem in direzione longitudinale è pari a:

$$L_{dl,sup} = 2.2 \text{ m} + [\tan 30^\circ \times (2 \times H_r + S_s/2)] = 3.24 \text{ m} \quad (\text{piano medio sol. sup.})$$

$$L_{dl,inf} = 2.2 \text{ m} + [\tan 30^\circ \times (2 \times H_r + S_s/2 + H + S_t/2)] = 7.25 \text{ m} \quad (\text{piano medio sol. inf.})$$

Diffusione del carico tandem in direzione trasversale (ortogonale all'asse stradale)

In direzione trasversale, considerando due colonne di carico e la ripartizione trasversale del carico distribuito, si ottiene quanto riportato nella figura seguente:

Per il calcolo delle azioni agenti sulle pareti dello scatolare, si considera il carico distribuito dovuto alla colonna di carico 1, limitando la diffusione del carico sul lato della seconda colonna di carico come schema seguente:

La larghezza di diffusione del carico tandem in direzione longitudinale è pari a:

$$L_{dt,sup} = 3 \text{ m} + [\tan 30^\circ \times (H_r + S_s/2)] = 3.66 \text{ m} \quad (\text{piano medio sol. sup.})$$

$$L_{dt,inf} = 3 \text{ m} + 2 \times [\tan 30^\circ \times (H_r + S_s + H + S_f/2)] = 7.68 \text{ m} \quad (\text{piano medio sol. inf.})$$

### Definizione dei carichi di progetto

Il diagramma di spinta applicato ai piedritti varia linearmente fra i valori  $q_{acc,sup2}$  e  $q_{acc,sup1}$  come esemplificato nella immagine seguente.

$$q_{acc,sup} = 2 \times Q_{1,k} \times (L_{dt,sup} \times L_{dl,sup}) \times k_0 = 22.24 \text{ kN/m}$$

$$q_{acc,inf} = 2 \times Q_{1,k} \times (L_{dt,inf} \times L_{dl,inf}) \times k_0 = 5.49 \text{ kN/m}$$

Loadings 20-23: spinta sul piedritto generata dal carico accidentale  $q1k = 9 \text{ kN/m}^2$  sul rilevato

Nelle condizioni di carico in oggetto si considera l'assenza del carico tandem:

$$p = k_0 \times q1k = 0.384 \times 9 = 3.46 \text{ kN/m (spinta a riposo, CDC 14 e 15, piedritto sinistro/destro)}$$

CDC 16-17: spinta sul piedritto generata dal sovraccarico da  $20 \text{ kN/m}^2$  sul rilevato

Nello scenario di carico da traffico alternativo allo Schema di Carico 1 si considera, ai fini del calcolo della spinta sui piedritti, un carico  $q_{acc}$  sul terrapieno pari a  $20 \text{ kN/m}^2$ .

Tale carico genera spinte pari a:

$p = k_0 \times q_{acc} = 0.384 \times 20 = 7.68 \text{ kN/m}$  (spinta a riposo, CDC 16 e 17, piedritto sinistro/destro)

### 7.2.6. Sovraccarichi accidentali sulla soletta di fondazione

Sulla soletta di fondazione si applica il carico tandem corrispondente a ciascuna colonna di carico  $Q_{i,k}$ , ripartito su una larghezza pari all'ingombro della colonna di carico convenzionale (3m), e una lunghezza ottenuta dalla ripartizione del carico fino al piano medio della soletta attraverso il ricoprimento, assumendo che detta diffusione avvenga con angolo di diffusione di  $30^\circ$  attraverso il rilevato stradale e di  $45^\circ$  sino al piano medio della soletta.

Base collaborante trasversale:  $B_T = 3.00 \text{ m}$

Ingombro longitudinale:  $L_L = 1.60 + 2 * (0.60 * \tan 30^\circ + 1.10/2) = 3.39 \text{ m}$

$q'_{acc,1} = 600/3.00/3.39 + 9 = 68.00 \text{ kN/m}^2$  (carico distribuito equivalente alla prima colonna di carico)

$q'_{acc,2} = 400/3.00/3.39 + 2.5 = 42.50 \text{ kN/m}^2$  (carico distribuito equivalente alla seconda colonna di carico)

(Condizioni Elementari CDC 15÷17)

### 7.2.7. Frenatura

La forza di frenatura  $q_3$  è funzione del carico totale agente sulla corsia convenzionale n.1 e risulta pari a (si veda il paragrafo 5.1.3.5 del D.M. 14/01/2008):

$$180 \text{ kN} \leq q_3 = 0.6 \times 2 \times Q_{1k} + 0.10 \times q_{1k} \times w_1 \times L \leq 900 \text{ kN}$$

dove:

$$Q_{1k} = 300 \text{ kN}$$

$$q_{1k} = 9 \text{ kN/m}^2$$

$$w_1 = 3.00 \text{ m (larghezza della corsia)}$$

$$L = 2 \times S_p + B_i \text{ (larghezza della soletta compresi i piedritti)}$$

Nel caso in esame risulta:

$$q_3 = 390.51 \text{ kN}$$

L'azione di cui sopra, viene distribuita sulla soletta superiore dello scatolare; il valore della frenatura equivalente da applicare alla soletta, si ottiene distribuendo il valore del carico frenante, alla lunghezza della soletta e alla larghezza di diffusione del carico ( $L_{dt}$ ), con la seguente relazione:

$$q_{3,dis} = 390.51 / ( 3.58 * 11.30 ) = 10.60 \text{ kN/m}^2$$

(applicata nel CDC 18)

## 7.2.8. Azioni sismiche

(CDC elementari 18-20)

### 7.2.8.1 Stato limite di salvaguardia della vita (SLV)

La risultante delle forze inerziali orizzontali indotte dal sisma viene valutata con la seguente espressione:

$$F_h = P \cdot k_h$$

$$k_h = \beta_m \cdot \frac{a_{max}}{g}$$

$$(SLV) \quad k_h = \beta_m \cdot \frac{a_{max}}{g} = 0.335 \quad k_v = \pm 0.5 \cdot k_h = 0.168$$

P = peso proprio;

k = coefficienti sismici;

Nel caso di sisma orizzontale si considera la spinta derivante dall'oscillazione del cuneo di terreno spingente con l'applicazione del diagramma triangolare di pressioni, tipico dei muri di sostegno, avente la risultante a 1/3 dell'altezza. Per tener conto dell'incremento di spinta del terreno dovuta al sisma si fa riferimento all'EC8, in cui l'incremento di spinta sismica  $\Delta P$  per la condizione a riposo viene valutato:

$$\Delta P_d = S \cdot a_g / g \cdot \gamma \cdot h_{tot}^2$$

La risultante di tale incremento di spinta viene applicata ad h/2 del piedritto.

1 - Ai fini delle azioni verticali sulla soletta superiore, non considerando i carichi accidentali si ha:

|                       |       |                   |
|-----------------------|-------|-------------------|
| Peso proprio soletta  | 25.00 | kN/m <sup>2</sup> |
| Carichi permanenti    | 22.80 | kN/m <sup>2</sup> |
| Inerzia soletta+perm. | 8.01  | kN/m <sup>2</sup> |

2 - Ai fini delle azioni orizzontali, sui piedritti si considera il contributo della sovraspinta sismica dovuto al sisma oscillatorio e le spinte inerziali agenti sui piedritti, mentre sulla soletta superiore si considera l'inerzia della stessa nonché i permanenti portati.

Spinta inerziale sulla soletta superiore:

$$P \cdot k_h = 16.03 \text{ kN/m}$$

Spinta inerziale sui piedritti:

$$P \cdot k_h = 8.38 \text{ kN/m}$$

$$P \cdot k_v = 4.19 \text{ kN/m}$$

Sovraspinta sismica:

$$k_h \times \gamma \times h_{\text{tot}} = 55.91 \text{ kN/m}$$

dove si indica con  $h_{\text{tot}}$  l'altezza totale del tombino compresi gli spessori delle solette superiore e inferiore più l'altezza di ricoprimento totale del tombino. Si fa osservare che tale metodologia porta ad azioni eccessivamente prudenziali, soprattutto per tombini con altezza di ricoprimento elevata.

### **7.2.9. Azioni termiche**

Sono stati considerati gli effetti dovuti alle variazioni termiche. In particolare, è stata considerata una variazione termica uniforme di  $\pm 10^\circ\text{C}$  sulla soletta superiore (CDC 22) ed un salto termico di  $5^\circ\text{C}$  sulla soletta superiore e sui piedritti, analizzando nelle combinazioni di carico i due casi di intradosso più caldo dell'estradosso e viceversa agendo sul segno della sollecitazione, con andamento lineare nello spessore della soletta superiore e sui piedritti (CDC 21).

Per il coefficiente di dilatazione termica si assume:

$$\alpha = 10 \cdot 10^{-6} = 0.00001 \text{ } ^\circ\text{C}^{-1}$$

### 7.2.10. Ritiro

Si considera soggetta a fenomeni di ritiro la sola soletta superiore.

La deformazione totale da ritiro si può esprimere come:

$$\varepsilon_{cs} = \varepsilon_{cd} + \varepsilon_{ca}$$

dove:

$\varepsilon_{cs}$  è la deformazione totale per ritiro

$\varepsilon_{cd}$  è la deformazione per ritiro da essiccamento

$\varepsilon_{ca}$  è la deformazione per ritiro autogeno.

Il valore medio a tempo infinito della deformazione per ritiro da essiccamento:

$$\varepsilon_{cd,\infty} = k_h \cdot \varepsilon_{c0}$$

può essere valutato mediante i valori delle seguenti Tab. 11.2.Va-b (NTC) in funzione della resistenza caratteristica a compressione, dell'umidità relativa e del parametro  $h_0$ :

**Tabella 11.2.Va – Valori di  $\varepsilon_{c0}$**

| $h_0$ (mm) | $k_h$ |
|------------|-------|
| 100        | 1     |
| 200        | 0,85  |

|     |       |
|-----|-------|
| 300 | 0,75  |
| 400 | 0,725 |
| 500 | 0,7   |

I valori intermedi dei parametri indicati in tabella si ottengono per l'interpolazione lineare.

Il valore medio a tempo infinito della deformazione per ritiro autogeno  $\epsilon_{ca,\infty}$  può essere valutato

mediante l'espressione:

$$\epsilon_{ca,\infty} = -2.5 \cdot (f_{ck} - 10) \cdot 10^{-6} \quad (\text{con } f_{ck} \text{ in N/mm}^2)$$

Assumendo come umidità relativa

$$U_r = 70\%$$

Si ha il seguente valore del ritiro:

$$\epsilon_{cs} = -0.000298$$

Il modulo viscoso a tempo infinito, in considerazione del valore di  $h_0$ , della resistenza del calcestruzzo e della U.R., può cautelativamente essere assunto pari a  $\Phi (t = \infty) = 1.6$ . Il modulo elastico ridotto del calcestruzzo risulta quindi pari a:

$$E_c^* = E_c / (1 + \Phi) = 12426.25 \text{ N/mm}^2. \text{ (CDC 22)}$$

### 7.3.5. Combinazioni per lo stato limite ultimo di Salvaguardia della vita

Si considera il sisma agente nella direzione trasversale dello scatolare (gli effetti del sisma agente nella direzione longitudinale del manufatto sono poco rilevanti), associato al sisma in direzione verticale (considerando in alternativa entrambi i versi d'azione). La non contemporaneità della massima azione verticale e orizzontale viene tenuta in conto, come prescritto dalle NTC 2008 (Par. 7.3.5), considerando i 4 seguenti scenari:

$$E_1 = 1.00 E_H + 0.30 E_V + (\text{sisma orizzontale al } 100\%, \text{ sisma verticale verso l'alto al } 30\%)$$

$$E_2 = 1.00 E_H + 0.30 E_V - (\text{sisma orizzontale al } 100\%, \text{ sisma verticale verso il basso al } 30\%)$$

$$E_3 = 0.30 E_H + 1.00 E_V + (\text{sisma orizzontale al } 30\%, \text{ sisma verticale verso l'alto al } 100\%)$$

$$E_4 = 0.30 E_H + 1.00 E_V - (\text{sisma orizzontale al } 30\%, \text{ sisma verticale verso il basso al } 100\%)$$

## 7.5. Verifiche di resistenza ed a fessurazione

Di seguito si riportano le verifiche delle sezioni per le aste più significative e per le Combinazioni di carico risultate più critiche.

Le verifiche a flessione sono effettuate rispettivamente:

- nella sezione ubicata a metà fra asse piedritto e sezione d'attacco piedritto-soletta nel caso delle verifiche della soletta;
- nella sezione ubicata a metà fra asse soletta e sezione d'attacco del piedritto nel caso delle verifiche del piedritto.

Le verifiche a taglio sono eseguite nelle sezioni di attacco soletta-piedritto.

I calcoli di verifica sono effettuati con il metodo degli Stati Limite, applicando il combinato D. M.14.01.2008 con l'UNI EN 1992 (Eurocodice 2).

Le verifiche a fessurazione sono state condotte considerando:

Verifica di formazione delle fessure: la verifica si esegue per la sezione interamente reagente e per le sollecitazioni di esercizio si determina la massima trazione nel calcestruzzo  $\sigma_{ct}$ , confrontandola con la resistenza caratteristica a trazione per flessione  $f_{ctk}$ : se risulta  $\sigma_{ct} < f_{ctk}$  la verifica è soddisfatta, altrimenti si procede alla verifica di apertura delle fessure.

Verifica di apertura delle fessure: l'apertura convenzionale delle fessure è calcolata con le modalità indicate nell'EC2, come richiesto dal D. M. Min. II. TT. del 14 gennaio 2008, e valutata con le sollecitazioni relative

alle Combinazioni FR o QP della normativa vigente sui ponti stradali". La massima apertura ammissibile risulta rispettivamente per le strutture in ambiente ordinario ed armature poco sensibili:

1) combinazione di carico Frequente:

$$w_k \leq w_3 = 0.40 \text{ mm}$$

2) combinazione di carico quasi permanente:

$$w_k \leq w_2 = 0.30 \text{ mm}$$

Nel caso di strutture in ambiente molto aggressivo ed armature poco sensibili:

1) combinazione di carico Frequente:

$$w_k \leq w_1 = 0.20 \text{ mm}$$

2) combinazione di carico quasi permanente:

$$w_k \leq w_1 = 0.20 \text{ mm}$$

Verifica delle tensioni di esercizio: si eseguono per la condizione di carico Quasi Permanente e Rara, verificando rispettivamente che le tensioni di lavoro siano inferiori ai seguenti limiti:

per la condizione QP si verifica che le massime tensioni presenti nel calcestruzzo siano inferiori a  $\sigma_c < 0.45 f_{ck}$ ;

per la condizione rara si verifica che le massime tensioni presenti nel calcestruzzo siano inferiori a  $\sigma_c < 0.60 f_{ck}$ , mentre quelle dell'acciaio  $\sigma_s < 0.80 f_{yk}$

### 7.5.9. Armatura di ripartizione dello scatolare

L'armatura di ripartizione nelle solette e nelle pareti dello scatolare (direzione y) viene posta in misura non inferiore al 20% dell'armatura principale (direzione x) (EC2 § 9.3).

L'armatura di ripartizione viene disposta non uniformemente, ma leggermente maggiorata nei punti in cui è maggiore anche l'armatura principale, punti in cui, peraltro, risultano maggiori le sollecitazioni trasversali alla luce di calcolo dello scatolare. Ad esempio, l'armatura di ripartizione viene posta in quantità maggiore all'intradosso della sezione di mezzera della soletta superiore che è il punto dove si hanno i maggiori momenti secondari dovuti ai carichi mobili stradali ed alla sovrastruttura stradale (gli unici carichi non uniformemente distribuiti sulla larghezza dello scatolare e quindi gli unici carichi che danno azioni flessionali trasversali). Essendo tali carichi ubicati al centro dello scatolare, essi generano azioni flessionali che tendono le fibre poste all'intradosso, dove viene appunto incrementata l'armatura di ripartizione.

Semplici valutazioni consentono di provare che l'armatura di ripartizione pari al 20% della principale è sicuramente sufficiente per assorbire le azioni flessionali trasversali secondarie, ovvero nella direzione ortogonale a quella di massima inflessione della soletta.

Come già osservato la massima azione flessionale secondaria si ha nella soletta superiore, perché solo qui sono applicate azioni non uniformemente distribuite su un intero elemento strutturale; tali azioni localizzate sono i carichi mobili stradali ed il peso della sovrastruttura.

Schematizzando, la soletta superiore come una lastra infinitamente lunga in direzione y, appoggiata sui bordi distanti  $l_x = (1.00/2 + 9.30 + 1.00/2)m = 10.30m$ , si valuta con l'ausilio di risultati tabellati (formule di BITTNER, vedi Allegato C) il massimo momento flettente in direzione y sotto l'effetto di una fascia caricata di larghezza  $t_y = 10.2$  m (larghezza caricata) per i carichi permanenti e variabili, e di lunghezza  $t_{x-var} = 3.35m$  (lunghezza di diffusione longitudinale dei carichi da traffico) per i carichi variabili, mentre per i carichi permanenti  $t_{x-perm} = 10.30m$ .

Contributo dei carichi permanenti:

$$p_{perm} = 22 \cdot 0.40 + 20 \cdot 0.70 = 22.80 \text{ kN/m}^2$$

$$p_{perm-SLU} = 22 \cdot 0.40 \cdot 1.35 + 20 \cdot 0.70 \cdot 1.35 = 30.78 \text{ kN/m}^2$$

$$P = p \cdot t_y \cdot t_x = 22.80 \cdot 10.2 \cdot 10.30 = 2,383.76 \text{ kN}$$

$$P_{SLU} = p_{SLU} \cdot t_y \cdot t_x = 3,218.07 \text{ kN}$$

$$l_y = \infty \quad t_y/l_x = 0.99 \Rightarrow 1 \quad t_x/l_x = 1.00 \quad \alpha_{ym} = 0.0214$$

Il massimo momento trasversale risulta:

$$M_{ym;SLE} = \alpha_{ym} * P = 50.89 \text{ kNm/m}$$

$$M_{ym,SLU} = \alpha_{ym} * P_{SLU} = 68.71 \text{ kNm/m}$$

Contributo dei carichi variabili:

$$p_{var} = (600+400+200)/(10.2 * 3.35) + 9 = 44.29 \text{ kN/m}^2$$

$$p_{var,SLU} = 44.29 * 1.35 = 59.79 \text{ kN/m}^2$$

$$P = p * t_y * t_x = 44.29 * 10.2 * 3.35 = 1,528.21 \text{ kN}$$

$$P_{SLU} = p_{SLU} * t_y * t_x = 59.79 * 10.2 * 3.35 = 2,063.09 \text{ kN}$$

$$l_y = \infty \quad t_y/l_x = 0.99 \Rightarrow 1 \quad t_x/l_x = 0.33 \quad \alpha_{ym} = 0.0335$$

Il massimo momento trasversale risulta:

$$M_{ym;SLE} = \alpha_{ym} * P = 51.16 \text{ kNm/m}$$

$$M_{ym,SLU} = \alpha_{ym} * P_{SLU} = 69.07 \text{ kNm/m}$$

Sollecitazioni totali:

$$M_{ym;SLE} = 102.06 \text{ kNm/m}$$

$$M_{ym,SLU} = 137.78 \text{ kNm/m}$$

Si noti, inoltre, che l'ipotesi di lastra di lunghezza indefinita porta sicuramente a sovrastimare i momenti trasversali e che nel punto di massimo momento trasversale l'armatura di ripartizione è molto maggiore, essendo presenti anche le barre distanziatrici (non messe in conto nella verifica precedente).

Pertanto si può affermare che l'armatura di ripartizione assunta pari al 20% della principale è largamente sufficiente in relazione alle modeste sollecitazioni trasversali secondarie che possono nascere nella struttura dello scatolare.

In Allegato B si riporta un prospetto illustrativo con i risultati tabellati per la determinazione delle sollecitazioni trasversali nelle piastre rettangolari appoggiate sui quattro lati caricate uniformemente su una zona rettangolare centrale (formule di BITTNER).

## 8. Verifiche geotecniche

---

### 8.1. Verifica della capacità portante del terreno di fondazione

---

Considerando il tipo di struttura, ai fini della verifica della portanza del terreno stesso, non si ritengono significativi gli squilibri dovuti a spinte orizzontali non simmetriche o ad azioni orizzontali applicate alla sommità dello scatolare quali frenatura o sisma.

Al proposito si fa notare che dette spinte (o azioni) sono state applicate sul telaio piano schematizzante la canna scatolare senza considerare in alcun modo l'effetto di contenimento laterale esercitato dal terreno di rinfiacco al fine di massimizzare gli effetti flessionali agenti sui piedritti (e sulle solette) del tombino.

Pertanto nel seguito le pressioni agenti sul terreno di fondazione vengono calcolate in presenza dei soli carichi verticali:

- peso proprio sezione scatolare
- peso terreno di ricoprimento e pavimentazione stradale
- carichi accidentali da traffico
- peso ricoprimento interno allo scatolare senza tenere in conto la presenza di azioni orizzontali.
- Carichi accidentali da traffico sulla soletta inferiore

Ai fini della combinazione dei carichi verranno utilizzati i seguenti coefficienti di norma:

A1-STR:  $1.35 (G_1 + G_2 + G_3) + 1.35 Q$

A2-GEO:  $G_1 + G_2 + G_3 + 1.15 Q$

Fra i carichi accidentali elencati:

- Carico mobile veicolare sulla soletta superiore, posizione per massimo momento in mezzeria soletta superiore
- Carico mobile veicolare sulla soletta superiore, posizione per massimo taglio all'attacco del piedritto dx

- Sovraccarico uniforme da 20kPa sulle soletta superiore

verrà considerato di volta in volta il carico più sfavorevole ai fini della determinazione:

- del massimo carico verticale agente ad intradosso fondazione ;
- della massima pressione di contatto terreno/fondazione.

Nelle tabelle seguenti, si fornisce per entrambi gli scenari di norma elencati e per ognuna delle due "condizioni di verifica" sopra descritte:

- nella prima colonna il carico considerato ;
- nella seconda colonna la reazione verticale (agente su un metro di fondazione) indotta dal carico in esame (N, [kN]);
- nella terza colonna il momento (agente su un metro di fondazione) indotto dal carico in esame (M, [kN.m]);
- nella quarta colonna l'eccentricità della reazione verticale ( $e=M/N$ , [m]);
- nella quinta colonna il coefficiente di combinazione del carico in esame.

Si riportano quindi nell'ultima riga:

- il carico  $N_{tot}$  agente ad intradosso fondazione (ogni metro di canna) nella combinazione in esame ;
- il momento  $M_{tot}$  agente ad intradosso fondazione (ogni metro di canna) nella combinazione in esame ;
- l'eccentricità della reazione verticale  $e = M_{tot} / N_{tot}$  ;
- la pressione di contatto terreno/fondazione valutate con la teoria di *Mayerhof* :

$$\sigma_{terr} = N_{tot} / (B_i + 2 \times S_p + 2 \times S_b - 2 \times e) \text{ [kPa]}$$

|---|-------------------------------|

| 3 | materiale tipo muratura       |
| 4 | materiale tipo legno          |
| 5 | materiale tipo generico       |

I materiali utilizzati nella modellazione sono individuati da una sigla identificativa ed un codice numerico (gli elementi strutturali richiamano quest'ultimo nella propria descrizione). Per ogni materiale vengono riportati in tabella i seguenti dati:

## MODELLAZIONE DELLE SEZIONI

### LEGENDA TABELLA DATI SEZIONI

Il programma consente l'uso di sezioni diverse. Sono previsti i seguenti tipi di sezione:

- 1 sezione di tipo generico
- 2 profilati semplici
- 3 profilati accoppiati e speciali

Le sezioni utilizzate nella modellazione sono individuate da una sigla identificativa ed un codice numerico (gli elementi strutturali richiamano quest'ultimo nella propria descrizione). Per ogni sezione vengono riportati in tabella i seguenti dati:

|              |   |
|--------------|---|
| <b>Area</b>  | area della sezione  |
| <b>A V2</b>  | area della sezione/fattore di taglio (per il taglio in direzione 2) |
| <b>A V3</b>  | area della sezione/fattore di taglio (per il taglio in direzione 3) |
| <b>Jt</b>    | fattore torsionale di rigidezza                                     |
| <b>J2-2</b>  | momento d'inerzia della sezione riferito all'asse 2                 |
| <b>J3-3</b>  | momento d'inerzia della sezione riferito all'asse 3                 |
| <b>W2-2</b>  | modulo di resistenza della sezione riferito all'asse 2              |
| <b>W3-3</b>  | modulo di resistenza della sezione riferito all'asse 3              |
| <b>Wp2-2</b> | modulo di resistenza plastico della sezione riferito all'asse 2     |
| <b>Wp3-3</b> | modulo di resistenza plastico della sezione riferito all'asse 3     |

I dati soprariportati vengono utilizzati per la determinazione dei carichi inerziali e per la definizione delle rigidezze degli elementi strutturali; qualora il valore di Area V2 (e/o Area V3) sia nullo la deformabilità per taglio V2 (e/o V3) è trascurata. La valutazione delle caratteristiche inerziali delle sezioni è condotta nel riferimento 2-3 dell'elemento.

Per quanto concerne i profilati semplici ed accoppiati l'asse 2 del riferimento coincide con l'asse x riportato nei più diffusi profilati.

Per quanto concerne le sezioni di tipo generico (tipo 1.):

i valori dimensionali con prefisso B sono riferiti all'asse 2

i valori dimensionali con prefisso H sono riferiti all'asse 3

|-------------|---------------------------|
| <b>Nodo</b> | numero del nodo.          |
| <b>X</b>    | valore della coordinata X |
| <b>Y</b>    | valore della coordinata Y |
| <b>Z</b>    | valore della coordinata Z |

Per i nodi ai quali sia associato un codice di vincolamento rigido, un codice di fondazione speciale o un set di molle viene indicato in tabella:

|                |   |
|----------------|---|
| <b>Nodo</b>    | numero del nodo.  |

| <b>Note</b>    | (FS = 1, 2,...) eventuale codice del tipo di fondazione speciale (1, 2,... fanno riferimento alle tipologie: plinto, palo, plinto su pali,...) che è collegato al nodo.<br>(ISO = "id SIGLA") indice e sigla identificativa dell' eventuale isolatore sismico assegnato al nodo |
| <b>Rig. TX</b> | valore della rigidezza dei vincoli elastici eventualmente applicati al nodo, nello specifico TX (idem per TY, TZ, RX, RY, RZ).  |

Per strutture sismicamente isolate viene inoltre inserita la tabella delle caratteristiche per gli isolatori utilizzati; le caratteristiche sono indicate in conformità al cap. 7.10 del D.M. 14/01/08

| <b>Svincolo I (J)</b> | codici di svincolo per le azioni interne; i primi sei codici si riferiscono al nodo iniziale, i restanti sei al nodo finale (il valore 1 indica che la relativa azione interna non è attiva)  |
| <b>Wink V</b>         | costante di sottofondo (coefficiente di Winkler) per la modellazione della trave su suolo elastico  |
| <b>Wink O</b>         | costante di sottofondo (coefficiente di Winkler) per la modellazione del suolo elastico orizzontale   |

### MODELLAZIONE DELLE AZIONI

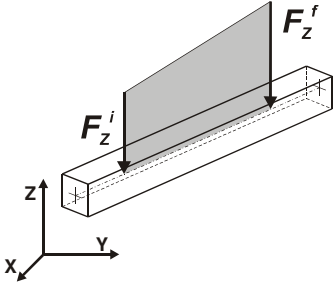

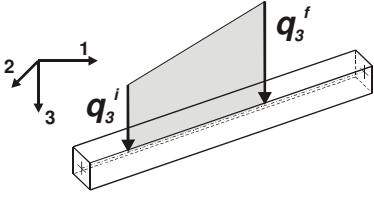

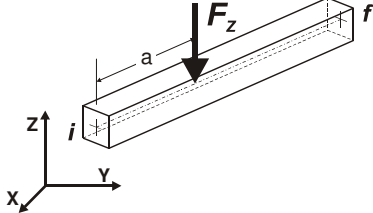

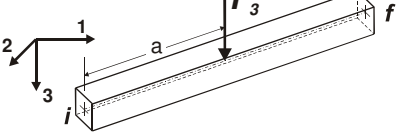

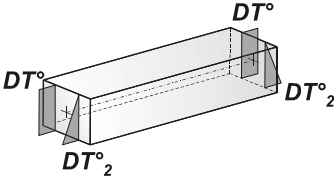

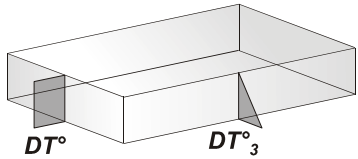

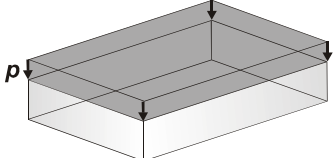

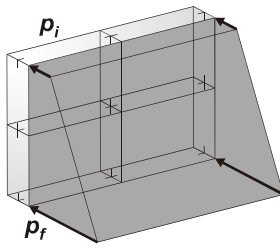

#### LEGENDA TABELLA DATI AZIONI

Il programma consente l'uso di diverse tipologie di carico (azioni). Le azioni utilizzate nella modellazione sono individuate da una sigla identificativa ed un codice numerico (gli elementi strutturali richiamano quest'ultimo nella propria descrizione). Per ogni azione applicata alla struttura viene di riportato il codice, il tipo e la sigla identificativa. Le tabelle successive dettagliano i valori caratteristici di ogni azione in relazione al tipo. Le tabelle riportano infatti i seguenti dati in relazione al tipo:

## SCHEMATIZZAZIONE DEI CASI DI CARICO

### LEGENDA TABELLA CASI DI CARICO

Il programma consente l'applicazione di diverse tipologie di casi di carico.

Sono previsti i seguenti 11 tipi di casi di carico:

|    | Sigla | Tipo | Descrizione   |
|----|-------|------|---|
| 1  | Ggk   | A    | caso di carico comprensivo del peso proprio struttura                                   |
| 2  | Gk    | NA   | caso di carico con azioni permanenti  |
| 3  | Qk    | NA   | caso di carico con azioni variabili   |
| 4  | Gsk   | A    | caso di carico comprensivo dei carichi permanenti sui solai e sulle coperture           |
| 5  | Qsk   | A    | caso di carico comprensivo dei carichi variabili sui solai                              |
| 6  | Qnk   | A    | caso di carico comprensivo dei carichi di neve sulle coperture                          |
| 7  | Qtk   | SA   | caso di carico comprensivo di una variazione termica agente sulla struttura             |
| 8  | Qvk   | NA   | caso di carico comprensivo di azioni da vento sulla struttura                           |
| 9  | Esk   | SA   | caso di carico sismico con analisi statica equivalente                                  |
| 10 | Edk   | SA   | caso di carico sismico con analisi dinamica   |
| 11 | Pk    | NA   | caso di carico comprensivo di azioni derivanti da coazioni, cedimenti e precompressioni |

Sono di tipo automatico A (ossia non prevedono introduzione dati da parte dell'utente) i seguenti casi di carico: 1-Ggk; 4-Gsk; 5-Qsk; 6-Qnk.

Sono di tipo semi-automatico SA (ossia prevedono una minima introduzione dati da parte dell'utente) i seguenti casi di carico:

7-Qtk, in quanto richiede solo il valore della variazione termica;

9-Esk e 10-Edk, in quanto richiedono il valore dell'angolo di ingresso del sisma e l'individuazione dei casi di carico partecipanti alla definizione delle masse.

Sono di tipo *non automatico NA* ossia prevedono la diretta applicazione di carichi generici agli elementi strutturali (si veda il precedente punto Modellazione delle Azioni) i restanti casi di carico.

Nella tabella successiva vengono riportati i casi di carico agenti sulla struttura, con l'indicazione dei dati relativi al caso di carico stesso:  
*Numero Tipo e Sigla identificativa, Valore di riferimento del caso di carico (se previsto).*

In successione, per i casi di carico non automatici, viene riportato l'elenco di nodi ed elementi direttamente caricati con la sigla identificativa del carico.

Per i casi di carico di tipo sismico (9-Esk e 10-Edk), viene riportata la tabella di definizione delle masse: per ogni caso di carico partecipante alla definizione delle masse viene indicata la relativa aliquota (partecipazione) considerata. Si precisa che per i caso di carico 5-Qsk e 6-Qnk la partecipazione è prevista localmente per ogni elemento solaio o copertura presente nel modello (si confronti il valore Sksol nel capitolo relativo agli elementi solaio) e pertanto la loro partecipazione è di norma pari a uno.

**DEFINIZIONE DELLE COMBINAZIONI**

**LEGENDA TABELLA COMBINAZIONI DI CARICO**

Il programma combina i diversi tipi di casi di carico (CDC) secondo le regole previste dalla normativa vigente.

Le combinazioni previste sono destinate al controllo di sicurezza della struttura ed alla verifica degli spostamenti e delle sollecitazioni.

La prima tabella delle combinazioni riportata di seguito comprende le seguenti informazioni: *Numero, Tipo, Sigla identificativa*. Una seconda tabella riporta il *peso nella combinazione*, assunto per ogni caso di carico.

Ai fini delle verifiche degli stati limite si definiscono le seguenti combinazioni delle azioni:

**Combinazione fondamentale SLU**

$$\gamma G_1 \cdot G_1 + \gamma G_2 \cdot G_2 + \gamma P \cdot P + \gamma Q_1 \cdot Q_{k1} + \gamma Q_2 \cdot \psi_{02} \cdot Q_{k2} + \gamma Q_3 \cdot \psi_{03} \cdot Q_{k3} + \dots$$

**Combinazione caratteristica (rara) SLE**

$$G_1 + G_2 + P + Q_{k1} + \psi_{02} \cdot Q_{k2} + \psi_{03} \cdot Q_{k3} + \dots$$

**Combinazione frequente SLE**

$$G_1 + G_2 + P + \psi_{11} \cdot Q_{k1} + \psi_{22} \cdot Q_{k2} + \psi_{23} \cdot Q_{k3} + \dots$$

**Combinazione quasi permanente SLE**

$$G_1 + G_2 + P + \psi_{21} \cdot Q_{k1} + \psi_{22} \cdot Q_{k2} + \psi_{23} \cdot Q_{k3} + \dots$$

**Combinazione sismica**, impiegata per gli stati limite ultimi e di esercizio connessi all'azione sismica E

$$E + G_1 + G_2 + P + \psi_{21} \cdot Q_{k1} + \psi_{22} \cdot Q_{k2} + \dots$$

**Combinazione eccezionale**, impiegata per gli stati limite connessi alle azioni eccezionali

$$G_1 + G_2 + P + \psi_{21} \cdot Q_{k1} + \psi_{22} \cdot Q_{k2} + \dots$$

Nelle verifiche possono essere adottati in alternativa, due diversi approcci progettuali:

- per l'approccio 1 si considerano due diverse combinazioni di gruppi di coefficienti di sicurezza parziali per le azioni, per i materiali e per la resistenza globale (combinazione 1 con coefficienti A1 e combinazione 2 con coefficienti A2),

- per l'approccio 2 si definisce un'unica combinazione per le azioni, per la resistenza dei materiali e per la resistenza globale (con coefficienti A1).

## RISULTATI NODALI

### LEGENDA RISULTATI NODALI

Il controllo dei risultati delle analisi condotte, per quanto concerne i nodi strutturali, è possibile in relazione alle tabelle sottoriportate.

Una prima tabella riporta infatti per ogni nodo e per ogni combinazione (o caso di carico) gli spostamenti nodali.

Una seconda tabella riporta per ogni nodo a cui sia associato un vincolo rigido e/o elastico o una fondazione speciale e per ogni combinazione (o caso di carico) i valori delle azioni esercitate dalla struttura sui vincoli (reazioni vincolari cambiate di segno).

Una terza tabella, infine riassume per ogni nodo le sei combinazioni in cui si attingono i valori minimi e massimi della reazione Fz, della reazione Mx e della reazione My.

## RISULTATI OPERE DI FONDAZIONE

### LEGENDA RISULTATI OPERE DI FONDAZIONE

Il controllo dei risultati delle analisi condotte, per quanto concerne le opere di fondazione, è possibile in relazione alle tabelle sottoriportate.

La prima tabella è riferita alle fondazioni tipo palo e plinto su pali.

Per questo tipo di fondazione vengono riportate le sei componenti di sollecitazione (espresse nel riferimento globale della struttura) per ogni palo componente l'opera.

In particolare viene riportato:

|              |   |
|--------------|---|
| <b>Nodo</b>  | numero del nodo a cui è applicato il plinto   |
| <b>Tipo</b>  | codice corrispondente al nome assegnato al tipo di plinto di fondazione:<br>3) palo singolo (PALO)<br>4) plinto su palo<br>5) plinto su due pali (PL.2P)<br>6) plinto su tre pali (PL.3P)<br>7) plinto su quattro pali (PL.4P)<br>8) plinto rettangolare su cinque pali (PL.5P.R)<br>9) plinto pentagonale su cinque pali (PL.5P)<br>10) plinto su sei pali (PL.6P) |
| <b>Palo</b>  | numero del palo   |
| <b>Comb.</b> | combinazione di carico in cui si verificano le sei componenti di sollecitazione.  |
| <b>Quota</b> | quota assoluta della sezione del palo per cui si riportano le sei componenti di sollecitazione.   |

L'azione Fz ( corrispondente allo sforzo normale nel palo) è costante poiché il peso del palo stesso non è considerato nella modellazione.

La seconda tabella è riferita alle fondazioni tipo plinto su suolo elastico.

Per questo tipo di fondazione vengono riportate le pressioni nei quattro vertici dell'impronta sul terreno.

In particolare viene riportato:

|                             |  |
|-----------------------------|--|
| <b>Nodo</b>                 | numero del nodo a cui è applicato il plinto                    |
| <b>Tipo</b>                 | Codice identificativo del nome assegnato al plinto             |
| <b>area</b>                 | area dell'impronta del plinto                                  |
| <b>Wink O</b> <b>Wink V</b> | coefficienti di Winkler (orizzontale e verticale) adottati     |
| <b>Comb</b>                 | Combinazione di carico in cui si verificano i valori riportati |
| <b>Pi (P1 P2 P3 P4)</b>     | valori di pressione nei vertici                                |

La terza tabella è riferita alle fondazioni tipo platea su suolo elastico.

Per questo tipo di fondazione vengono riportate le pressioni in ogni vertice (nodo) degli elementi costituenti la platea.

La quarta tabella è riferita alle fondazioni tipo trave su suolo elastico.

Per questo tipo di fondazione vengono riportate le pressioni alle estremità dell'elemento e la massima (in valore assoluto) pressione lungo lo sviluppo dell'elemento.

Vengono inoltre riportati, con funzione statistica, i valori massimo e minimo delle pressioni che compaiono nella tabella.

## RISULTATI ELEMENTI TIPO TRAVE

### LEGENDA RISULTATI ELEMENTI TIPO TRAVE

Il controllo dei risultati delle analisi condotte, per quanto concerne gli elementi tipo trave, è possibile in relazione alle tabelle sottoriportate.

Gli elementi vengono suddivisi, in relazione alle proprietà in elementi:

- tipo **pilastro**
- tipo **trave in elevazione**
- tipo **trave in fondazione**

Per ogni elemento, e per ogni combinazione (o caso di carico) vengono riportati i risultati più significativi.

Per gli elementi tipo *pilastro* sono riportati in tabella i seguenti valori:

|                     |  |
|---------------------|--|
| <b>Pilas.</b>       | numero dell'elemento pilastro  |
| <b>Cmb</b>          | combinazione in cui si verificano i valori riportati                     |
| <b>M3 mx/mn</b>     | momento flettente in campata M3 max (prima riga) / min (seconda riga)    |
| <b>M2 mx/mn</b>     | momento flettente in campata M2 max (prima riga) / min (seconda riga)    |
| <b>D2/D3</b>        | freccia massima in direzione 2 (prima riga) / direzione 3 (seconda riga) |
| <b>Q2/Q3</b>        | carico totale in direzione 2 (prima riga) / direzione 3 (seconda riga)   |
| <b>Pos.</b>         | ascissa del punto iniziale e finale dell'elemento                        |
| <b>N, V2, ecc..</b> | sei componenti di sollecitazione al piede ed in sommità dell'elemento    |

Per gli elementi tipo *trave in elevazione* sono riportati, oltre al numero dell'elemento, i medesimi risultati visti per i pilastri.

Per gli elementi tipo *trave in fondazione* (trave f.) sono riportati, oltre al numero dell'elemento, i medesimi risultati visti per i pilastri e la massima pressione sul terreno.
