**1 PREMESSA**

Oggetto della trattazione nel seguito esposta è in particolare il dimensionamento strutturale dei tombini, dei pozzetti e delle vasche di raccolta e smaltimento delle acque defluenti nei tombini, ubicati generalmente a monte e/o valle delle opere di attraversamento, ed in qualche caso, in corrispondenza di salti intermedi.

In accordo alle disposizioni dettate dalle "Norme tecniche per le costruzioni" (DM 17.01.2018), sono state effettuate le verifiche agli stati limite di esercizio (SLE) e agli stati limite ultimi (SLU).

L'opera in esame è prevista nell'ambito dell'adeguamento della SS87 in direzione di Campobasso per un'estesa di circa 3.400 m in comune di Campolieto.

Per completezza, si riporta nella tabella seguente, l'elenco completo degli attraversamenti in progetto, con indicazione delle geometrie di ciascun pozzetto:

PROGRESSIVA km	POZZETTO INGRESSO				POZZETTO INTERMEDIO				POZZETTO USCITA

Tabella di sintesi pozzetti attraversamenti idraulici

Hint: Altezza interna Pozzetto;

Bint: Base interna Pozzetto;

Sf,Sp: Sono rispettivamente gli spessori della soletta di fondazione e delle pareti.

Planimetria e profilo tombino tipo con individuazione dei pozzetti

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

Nelle pagine seguenti sono riportati i risultati dell'analisi delle sollecitazioni e relative verifiche strutturali relativi a due tipologie di pozzetto:

POZZETTO TIPO 1: pozzetto di ingresso/intermedio con altezza interna pari a 7.40m (altezza maggiore tra i pozzetti di ingresso/uscita, a parità di spessore della parete) per il quale lo schema statico adottato è di parete vincolata su tre lati.

POZZETTO TIPO 2: pozzetto di uscita con altezza interna media pari a 2.80m (altezza maggiore tra i pozzetti di uscita, a parità di spessore della parete) per il quale lo schema statico adottato è di parete vincolata su due lati.

Lo studio viene effettuato sulla singola parete verticale dei pozzetti pochè le sollecitazioni di calcolo all'estremità della soletta inferiore sono pressochè coincidenti con quelle a base della parete verticale, per cui, essendo prevista la stessa sezione resistente, si omettono tali verifiche; stesse considerazioni valgono per il caso della sezione di mezzeria, dove le sollecitazioni di progetto sono sicuramente inferiori a quella di estremità.

Per quanto concerne i tombini sono tutti costituiti da tubi  $\Phi 1500$  con ricomprimenti diversi. In particolare, sotto la viabilità lo spessore varia da 0.60 m a circa 3.50 m, pertanto verranno calcolati entrambe i tombini.

Di seguito si riporta lo stralcio della sezione trasversale tipo:

Sezione trasversale tipo tombino  $\Phi 1500$

## **2** **NORMATIVA E RACCOMANDAZIONI**

La redazione della presente relazione è stata condotta nel rispetto della normativa in vigore, in particolare:

- D. Min. Infrastrutture 17 gennaio 2018 "Aggiornamento delle nuove norme tecniche per le costruzioni";
- Circolare 21 gennaio 2019 n. 7: Istruzioni per l'applicazione dell'"Aggiornamento delle nuove norme tecniche per le costruzioni" di cui al D.M. 17 gennaio 2018;
- CNR 10011/97, "Costruzioni di acciaio. Istruzioni per il calcolo, l'esecuzione, il collaudo e la manutenzione";
- CNR 10016/2000, "Strutture composte di acciaio e calcestruzzo. Istruzioni per l'impiego nelle costruzioni";
- CNR 10018/1999, "Apparecchi d'appoggio per le costruzioni – Istruzioni per l'impiego";
- CNR 10030/93, "Anime irrigidite di travi a parete piena";
- UNI EN 1991-1-5:2004 "Eurocodice 1 - Azioni sulle strutture - Parte 1-5: Azioni in generale - Azioni termiche";
- UNI EN 1992-1-1:2005, "Eurocodice 2 – Progettazione delle strutture di calcestruzzo - parte 1 - Regole generali e regole per edifici";

- Model Code 1990, CEB-FIP;
- Capitolato ANAS: "Norme tecniche per l'esecuzione del contratto", 2018.

### **3 CARATTERISTICHE DEI MATERIALI**

Si riportano qui di seguito le caratteristiche prestazionali dei materiali che saranno impiegati per la realizzazione delle opere in oggetto, secondo la normativa in vigore e con riferimento al metodo di calcolo agli stati limite.

- **Calcestruzzo per fondazioni**

Tipo (secondo UNI EN 206-1):	C32/40
Resistenza cubica caratteristica (t=28 gg):	$f_{ck, cube} \geq 40 \text{ N/mm}^2$
Resistenza cilindrica caratteristica (t=28 gg):	$f_{ck} \geq 32 \text{ N/mm}^2$
Modulo elastico secante:	$E_{cm} = 33.642 \text{ N/mm}^2$
Classe di consistenza:	S4
Rapporto massimo acqua / cemento	$A/C \leq 0.50$
Diametro massimo inerti:	30 mm
Classe di esposizione ambientale:	XC2
Copriferro minimo getti in opera	40 mm

- **Calcestruzzo per piedritti**

Tipo (secondo UNI EN 206-1):	C32/40
Resistenza cubica caratteristica (t=28 gg):	$f_{ck, cube} \geq 40 \text{ N/mm}^2$
Resistenza cilindrica caratteristica (t=28 gg):	$f_{ck} \geq 32 \text{ N/mm}^2$
Modulo elastico secante:	$E_{cm} = 33.642 \text{ N/mm}^2$
Classe di consistenza:	S4
Rapporto massimo acqua / cemento	$A/C \leq 0.50$
Diametro massimo inerti:	30 mm
Classe di esposizione ambientale:	XC2
Copriferro minimo getti in opera	40 mm

- **Acciaio per cemento armato**

Tipo: B 450 C	
Tensione caratteristica di rottura a trazione:	$f_{tk} \geq 540 \text{ N/mm}^2$
Tensione caratteristica di snervamento:	$f_{yk} \geq 450 \text{ N/mm}^2$

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

Tensione ammissibile:	$\sigma_{amm} = 260 \text{ N/mm}^2$
Tensione di calcolo ( $\gamma=1.15$ ):	$f_{yd} = 450 / 1.15 = 391 \text{ N/mm}^2$
Modulo elastico:	$E = 210'000 \text{ N/mm}^2$

La scelta del copriferro minimo di progetto  $c_{min}$  dei getti in opera, inteso come lo spessore minimo del ricoprimento dello strato di calcestruzzo a protezione dei ferri d'armatura, è stata determinata in base a quanto indicato nella circolare Esplicativa del D.M. 17 gennaio 2018, tenendo conto della classe di esposizione ambientale e della classe del Calcestruzzo prevista.

Nello specifico, tenendo conto della classe di esposizione ambientale ipotizzata si è evidenziato una Classe di Esposizione XC2 e pertanto Condizioni Ambientali "Ordinarie", in relazione a quanto riportato in tabella 4.1.III del DM 17.01.18 e in tabelle C4.1.IV della circolare applicativa, per le classi di calcestruzzo previste è prescritto un copriferro minimo  $c_{min} \geq 20\text{mm}$ . A tale valore va aggiunta una tolleranza di posa di 10 mm.

**Tab. 4.1.III – Descrizione delle condizioni ambientali**

Condizioni ambientali	Classe di esposizione
Ordinarie	X0, XC1, XC2, XC3, XF1
Aggressive	XC4, XD1, XS1, XA1, XA2, XF2, XF3
Molto aggressive	XD2, XD3, XS2, XS3, XA3, XF4

In definitiva ai fini progettuali si è assunto  $c = (20+10) = 30\text{mm}$  (in favore di sicurezza si è assunto  $c=40\text{mm}$ ) sia per le fondazioni che per i piedritti (C32/40 - barre da c.a. con elementi a piastra).

**Tabella C4.1.IV - Copriferri minimi in mm**

$C_{min}$	$C_0$	ambiente	barre da c.a. elementi a piastra		barre da c.a. altri elementi		cavi da c.a.p. elementi a piastra		cavi da c.a.p. altri elementi	
			$C \geq C_0$	$C_{min} \leq C < C_0$	$C \geq C_0$	$C_{min} \leq C < C_0$	$C \geq C_0$	$C_{min} \leq C < C_0$	$C \geq C_0$	$C_{min} \leq C < C_0$
C25/30	C35/45	ordinario	15	20	20	25	25	30	30	35
C30/37	C40/50	aggressivo	25	30	30	35	35	40	40	45
C35/45	C45/55	molto ag.	35	40	40	45	45	50	50	50

#### 4 CARATTERISTICHE GEOLOGICHE E IDROLOGICHE

I parametri geotecnici del terreno di fondazione sono stati ricavati dalla relazione geotecnica allegata al progetto. Da tale relazione risulta che nel tratto in oggetto la falda è posta a 2 m dal piano campagna.

Per il terreno di fondazione si sono assunti i seguenti valori di caratterizzazione geotecnica:

Unità				Parametri drenati			Parametri non drenati	
	Da [m]	a [m]	$\gamma$ [KN/m <sup>3</sup> ]	c' [kPa]	$\phi$ [°]	M <sub>DS</sub> [MPa]	c <sub>u</sub> [kPa]	E <sub>u</sub> [MPa]
Strato 1	0	5	19	4	22	7.5	50	10
Strato 2	5	10	19	4	24	30	200	50
Strato 3	10	-	19	20	24	45	300	75

Per il rilevato si sono assunti i seguenti valori di caratterizzazione geotecnica:

Unità	$\gamma$	c'	$\phi'$	E'
	[KN/m <sup>3</sup> ]	[kPa]	[°]	[MPa]
Rilevato	20	0.0	35	30.0

##### 4.1 INTERAZIONE TERRENO-FONDAZIONE

Di seguito sono trattati gli aspetti di natura geotecnica riguardanti l'interazione terreno-struttura relativamente all'opera in esame.

Per la determinazione della costante di sottofondo si può fare riferimento alle seguenti formulazioni assimilando il comportamento del terreno a quello di un mezzo elastico omogeneo:

$$s = B \cdot c_t \cdot (q - \sigma_{v0}) \cdot (1 - \nu^2) / E$$

dove:

- s = cedimento elastico totale;
- B = lato minore della fondazione;
- c<sub>t</sub> = coefficiente adimensionale di forma ottenuto dalla interpolazione dei valori dei coefficienti proposti dal Bowles, 1960 (L = lato maggiore della fondazione):
 
$$c_t = 0.853 + 0.534 \ln(L/B) \text{ rettangolare con } L/B \leq 10$$

$$c_t = 2 + 0.0089 (L/B) \text{ rettangolare con } L/B > 10$$
- q = pressione media agente sul terreno;
- $\sigma_{v0}$  = tensione litostatica verticale alla quota di posa della fondazione;

- $\nu$  = coefficiente di Poisson del terreno;
- $E$  = modulo elastico medio del terreno sottostante.

Il valore della costante di sottofondo  $k_w$  è valutato attraverso il rapporto tra il carico applicato ed il corrispondente cedimento, pertanto si ottiene:

$$k_w = E / [(1-\nu^2) \cdot B \cdot C_t]$$

Di seguito si riportano, in forma tabellare, i risultati delle valutazioni effettuate per il caso in esame, sulla scorta del valore di progetto di  $E$  attribuito allo strato di fondazione (valore medio del modulo elastico a piccole deformazioni), avendo considerato una dimensione longitudinale della fondazione ritenuta potenzialmente collaborante:

$C_t$	2.178	-	Coefficiente di forma
$E$	7.5	MPa	Modulo deformabilità terreno in sito
$\nu$	0.2	-	Coefficiente di Poisson
$k_w$	0.024	N/mm <sup>2</sup> /cm	Costante di Winkler

Nelle verifiche è stato assunto  $k_w = 0.024$  N/mm<sup>2</sup>/cm.

## **5 CARATTERIZZAZIONE SISMICA**

Nel seguente paragrafo è riportata la valutazione dei parametri di pericolosità sismica utili alla determinazione delle azioni sismiche di progetto dell'opera cui si riferisce il presente documento.

### **5.1 VITA NOMINALE E CLASSE D'USO**

Per la valutazione dei parametri di pericolosità sismica è necessario definire, oltre alla localizzazione geografica del sito, la Vita nominale dell'opera strutturale ( $V_N$ ), intesa come il numero di anni nel quale la struttura, purché soggetta alla manutenzione ordinaria, deve potere essere usata per lo scopo al quale è destinata, e la Classe d'Uso a cui è associato un coefficiente d'uso ( $C_U$ )

Per l'opera in oggetto si considera una vita nominale:  $V_N = 50$  anni. Riguardo invece la Classe d'Uso, all'opera in oggetto corrisponde una Classe III a cui è associato un coefficiente d'uso pari a (NTC – Tabella 2.4.II):  $C_U = 2$ .

I parametri di pericolosità sismica vengono quindi valutate in relazione ad un periodo di riferimento  $V_R$  che si ricava per ciascun tipo di costruzione, moltiplicando la vita nominale  $V_N$  per il coefficiente d'uso  $C_U$ , ovvero:

$$V_R = V_N \cdot C_U$$

Pertanto, per l'opera in oggetto, il periodo di riferimento è pari a  $V_R = 50 \times 2 = 100$  anni

### **5.2 PARAMETRI DI PERICOLOSITA' SISMICA**

La valutazione dei parametri di pericolosità sismica, che ai sensi del D.M. 208, costituiscono il dato base per la determinazione delle azioni sismiche di progetto su una costruzione (forme spettrali e/o forze inerziali) dipendono, come già in parte anticipato in precedenza, dalla localizzazione geografica del sito, dalle caratteristiche della costruzione (Periodo di riferimento per valutazione azione sismica /  $V_R$ ) oltre che dallo Stato Limite di riferimento/Periodo di ritorno dell'azione sismica.

Le azioni sismiche vengono valutate in base alle accelerazioni massime attese in superficie pari a:

$$a_{\max} = S \cdot a_g = (S_S \cdot S_T) \cdot a_g \quad [7.11.8]$$

Dove:

$S$  = coefficiente che comprende l'effetto dell'amplificazione stratigrafica ( $S_S$ ) e dell'amplificazione topografica ( $S_T$ ), di cui al § 3.2.3.2;

$a_g$  = accelerazione orizzontale massima attesa su sito di riferimento rigido.

Con riferimento al D.M. del 17 gennaio 2018 si definiscono i seguenti parametri:

$V_N = 50$  anni (vita nominale)

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

Classe d'uso = IV	(strade di cat. A)
$C_U = 2$	(coefficiente d'uso)
$V_R = C_U \times V_n = 2 \times 50 = 100$ anni	(vita di riferimento)
Stato limite di verifica: SLV	(stato limite di salvaguardia della vita – cfr. DM-2018-7.1)
$P_{vr} = 10\%$	(probabilità di superamento dell'evento nella $V_r$ )
$T_R = 956$ anni	(periodo di ritorno)
Categoria suolo di fondazione: C	
Categoria topografica: T1	
Spettro di progetto: elastico	(smorzamento $\xi = 5\%$ , fattore $q = 1$ )

In particolare, il procedimento per la definizione dei parametri sismici di progetto per i vari Stati Limite è stato il seguente:

- Definizione della Vita Nominale e della Classe d'Uso della struttura, il cui uso combinato ha portato alla definizione del Periodo di Riferimento dell'azione sismica.
- Individuazione, tramite latitudine e longitudine, dei parametri sismici di base  $a_g$ ,  $F_0$  e  $T^*_c$  per lo Stato Limite di salvaguardia della vita; tramite le tabelle riportate nell'Allegato B della norma, è possibile definire i valori di  $a_g$ ,  $F_0$ ,  $T^*_c$ :  
 $a_g \rightarrow$  accelerazione orizzontale massima del terreno su suolo di categoria A, espressa come frazione dell'accelerazione di gravità;  
 $F_0 \rightarrow$  valore massimo del fattore di amplificazione dello spettro in accelerazione orizzontale;  
 $T^*_c \rightarrow$  periodo di inizio del tratto a velocità costante dello spettro in accelerazione orizzontale;
- Determinazione dei coefficienti d'amplificazione stratigrafica e topografica.
- Calcolo del periodo  $T_c$  corrispondente all'inizio del tratto a velocità costante dello Spettro.

Visto che l'azione sismica varia al variare delle coordinate geografiche, si sono assunti nei calcoli i valori massimi presenti nella tratta interessata:

$$a_g / g = 0.283$$

Nota la categoria di sottosuolo e la categoria topografica si hanno i seguenti valori dei coefficienti di amplificazione stratigrafica ( $S_s$ ) e di amplificazione topografica ( $S_t$ ) (§ 3.2.3.2.1 DM 17 gennaio 2018) e si definisce il coefficiente  $S$ :

$$S_s = 1.283$$

$$S_t = 1$$

$$S = S_s \cdot S_t = 1.283$$

L'accelerazione massima risulterebbe quindi:  $a_{max}(SLV) = S \cdot a_g = S_s \cdot a_g = 1.283 \cdot 0.283 = 0.363g$

## 6 COMBINAZIONI DI CARICO

Le combinazioni di carico, considerate ai fini delle verifiche, sono stabilite in modo da garantire la sicurezza in conformità a quanto prescritto al 6.7 del D.M. 17 gennaio 2018.

Le verifiche devono essere svolte con riferimento agli stati limite ultimi (SLU) e agli stati limite di esercizio (SLE).

### 6.1 STATO LIMITE ULTIMO

Le azioni sulla costruzione sono state cumulate in modo da determinare condizioni di carico tali da risultare più sfavorevoli ai fini delle singole verifiche, tenendo conto della probabilità ridotta di intervento simultaneo di tutte le azioni con i rispettivi valori più sfavorevoli, come consentito dalle norme vigenti.

Per gli stati limite ultimi sono state adottate le combinazioni al punto 2.5.3. D.M. 17 gennaio 2018 del tipo:

Combinazione Fondamentale

$$\gamma_{G1} \cdot G_1 + \gamma_{G2} \cdot G_2 + \gamma_P \cdot P + \gamma_{Q1} \cdot Q_{k1} + \gamma_{Q2} \cdot \psi_{02} \cdot Q_{k2} + \gamma_{Q3} \cdot \psi_{03} \cdot Q_{k3} + \dots \quad [2.5.1]$$

Combinazione sismica

$$E + G_1 + G_2 + P + \psi_{21} \cdot Q_{k1} + \psi_{22} \cdot Q_{k2} + \dots \quad [2.5.5]$$

Combinazione eccezionale

$$G_1 + G_2 + P + A_d + \psi_{21} \cdot Q_{k1} + \psi_{22} \cdot Q_{k2} + \dots \quad [2.5.6]$$

Dove:

- permanenti (G): azioni che agiscono durante tutta la vita nominale di progetto della costruzione, la cui variazione di intensità nel tempo è molto lenta e di modesta entità: peso proprio di tutti gli elementi strutturali; peso proprio del terreno, quando pertinente; forze indotte dal terreno (esclusi gli effetti di carichi variabili applicati al terreno); forze risultanti dalla pressione dell'acqua (quando si configurino costanti nel tempo) (G1); peso proprio di tutti gli elementi non strutturali (G2); spostamenti e deformazioni impressi, incluso il ritiro; presollecitazione (P).
- variabili (Q): azioni che agiscono con valori istantanei che possono risultare sensibilmente diversi fra loro nel corso della vita nominale della struttura: sovraccarichi; azioni del vento; azioni della neve; azioni della temperatura.
- eccezionali (A): azioni che si verificano solo eccezionalmente nel corso della vita nominale della struttura; incendi; esplosioni; urti ed impatti;
- sismiche (E): azioni derivanti dai terremoti.

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

I coefficienti moltiplicativi delle azioni (Tab. 2.6.I del D.M. 17 gennaio 2018) si differenziano in  $\gamma_{G1}$  coefficiente parziale dei carichi permanenti  $G_1$ ,  $\gamma_{G2}$  coefficiente parziale dei carichi permanenti non strutturali  $G_2$  e  $\gamma_{Qi}$  coefficiente parziale delle azioni variabili  $Q$ . Con riferimento alla durata relativa ai livelli di intensità di un'azione variabile, si definiscono:  $\Psi_{2j} Q_{kj}$  (il valore istantaneo superato oltre il 50% del tempo nel periodo di riferimento),  $\Psi_{1j} Q_{kj}$  (il valore superato per un periodo totale di tempo che rappresenti una piccola frazione del periodo di riferimento),  $\Psi_{0j} Q_{kj}$  (il valore tale che la probabilità di superamento degli effetti causati dalla concomitanza con altre azioni sia circa la stessa di quella associata al valore caratteristico di una singola azione).

Le verifiche agli stati limite ultimi devono essere eseguite con l'Approccio 1, considerando le due combinazioni di coefficienti

Combinazione 1: (A1+M1+R1)

Combinazione 2: (A2+M2+R2)

con i valori dei coefficienti parziali riportati nelle Tabelle 6.2.I, 6.2.II e con i coefficienti  $J_R$  dei gruppi R1 e R2 pari all'unità.

**Tab. 6.2.I – Coefficienti parziali per le azioni o per l'effetto delle azioni**

	Effetto	Coefficiente Parziale $\gamma_F$ (o $\gamma_E$ )	EQU	(A1)	(A2)
Carichi permanenti $G_1$	Favorevole	$\gamma_{G1}$	0,9	1,0	1,0
	Sfavorevole		1,1	1,3	1,0
Carichi permanenti $G_2^{(1)}$	Favorevole	$\gamma_{G2}$	0,8	0,8	0,8
	Sfavorevole		1,5	1,5	1,3
Azioni variabili $Q$	Favorevole	$\gamma_{Qi}$	0,0	0,0	0,0
	Sfavorevole		1,5	1,5	1,3

<sup>(1)</sup> Per i carichi permanenti  $G_2$  si applica quanto indicato alla Tabella 2.6.I. Per la spinta delle terre si fa riferimento ai coefficienti  $\gamma_{G1}$

**Tab. 6.2.II – Coefficienti parziali per i parametri geotecnici del terreno**

Parametro	Grandezza alla quale applicare il coefficiente parziale	Coefficiente parziale $\gamma_M$	(M1)	(M2)
Tangente dell'angolo di resistenza al taglio	$\tan \varphi'_k$	$\gamma_{\varphi'}$	1,0	1,25
Coazione efficace	$c'_k$	$\gamma_{c'}$	1,0	1,25
Resistenza non drenata	$c_{uk}$	$\gamma_{cu}$	1,0	1,4
Peso dell'unità di volume	$\gamma_V$	$\gamma_V$	1,0	1,0

I valori dei coefficienti  $\Psi_{0j}$ ,  $\Psi_{1j}$  e  $\Psi_{2j}$  sono riportati in Tab. 2.5.I del D.M. 17 gennaio 2018:

Tab. 2.5.I – Valori dei coefficienti di combinazione

Categoria/Azione variabile	$\Psi_{0j}$	$\Psi_{1j}$	$\Psi_{2j}$
Categoria A - Ambienti ad uso residenziale	0,7	0,5	0,3
Categoria B - Uffici	0,7	0,5	0,3
Categoria C - Ambienti suscettibili di affollamento	0,7	0,7	0,6
Categoria D - Ambienti ad uso commerciale	0,7	0,7	0,6
Categoria E – Aree per immagazzinamento, uso commerciale e uso industriale Biblioteche, archivi, magazzini e ambienti ad uso industriale	1,0	0,9	0,8
Categoria F - Rimesse, parcheggi ed aree per il traffico di veicoli (per autoveicoli di peso $\leq 30$ kN)	0,7	0,7	0,6
Categoria G – Rimesse, parcheggi ed aree per il traffico di veicoli (per autoveicoli di peso $> 30$ kN)	0,7	0,5	0,3
Categoria H - Coperture accessibili per sola manutenzione	0,0	0,0	0,0
Categoria I – Coperture praticabili	da valutarsi caso per caso		
Categoria K – Coperture per usi speciali (impianti, eliporti, ...)			
Vento	0,6	0,2	0,0
Neve (a quota $\leq 1000$ m s.l.m.)	0,5	0,2	0,0
Neve (a quota $> 1000$ m s.l.m.)	0,7	0,5	0,2
Variazioni termiche	0,6	0,5	0,0

Le combinazioni risultanti sono state costruite a partire dalle sollecitazioni caratteristiche calcolate per ogni condizione di carico elementare.

## 6.2 STATO LIMITE DI ESERCIZIO

Allo Stato Limite di Esercizio le sollecitazioni con cui sono stati progettati gli elementi in c.a. sono state ricavate applicando le combinazioni al punto 2.5.3. del D.M. 17 gennaio 2018, dove le azioni, i coefficienti moltiplicativi delle azioni e i coefficienti di combinazione sono definiti come al paragrafo precedente.

A seconda dei casi, si fa riferimento alle seguenti combinazioni di carico:

Combinazione caratteristica o rara

$$G_1 + G_2 + P + Q_{k1} + \Psi_{02} \cdot Q_{k2} + \Psi_{03} \cdot Q_{k3} + \dots \quad [2.5.2]$$

Combinazione frequente

$$G_1 + G_2 + P + \Psi_{11} \cdot Q_{k1} + \Psi_{22} \cdot Q_{k2} + \Psi_{23} \cdot Q_{k3} + \dots \quad [2.5.3]$$

Combinazione quasi permanente

$$G_1 + G_2 + P + \Psi_{21} \cdot Q_{k1} + \Psi_{22} \cdot Q_{k2} + \Psi_{23} \cdot Q_{k3} + \dots \quad [2.5.4]$$

In maniera analoga a quanto illustrato nel caso dello Stato limite ultimo, le combinazioni risultanti sono state costruite a partire dalle sollecitazioni caratteristiche calcolate per ogni condizione di carico. Per ognuna delle combinazioni ottenute, in funzione dell'elemento, sono state effettuate le verifiche allo SLE (tensioni, deformazioni e fessurazione).

Negli allegati tabulati di calcolo sono riportanti i coefficienti relativi alle combinazioni di calcolo generate relativamente alle combinazioni di azioni "Quasi Permanente", "Frequente" e "Rara".

## **7 CRITERI DI VERIFICA (STR)**

Il progetto delle opere in oggetto viene svolto secondo il metodo semiprobabilistico degli stati limite, in accordo alla normativa vigente (DM 17/01/2018. "Norme tecniche per le costruzioni"). L'analisi mira a garantire la sicurezza e le prestazioni attese attraverso il conseguimento dei requisiti di sicurezza nei confronti degli Stati Limite Ultimi (SLU) e di sicurezza nei confronti degli Stati Limite di Esercizio (SLE).

In questo caso occorrerà eseguire le sole verifiche a Stato Limite di tipo strutturale (STR).

L'analisi strutturale dell'opera in oggetto è condotta per le azioni statiche e sismiche illustrate nei paragrafi precedenti. Per le sezioni in cemento armato si effettuano:

- verifiche per gli stati limite ultimi a presso-flessione;
- verifiche per gli stati limite ultimi a taglio;
- verifiche agli stati limite di esercizio

Nella verifica degli elementi allo SLU si definiscono le combinazioni delle azioni in base al D.M. 17 gennaio 2018, ottenendo un insieme di sollecitazioni. A seguire si combinano tali sollecitazioni con quelle dovute all'eventuale azione del sisma. Per sollecitazioni semplici (flessione retta, taglio, etc.) si individuano i valori minimo e massimo con cui progettare o verificare l'elemento considerato; per sollecitazioni composte (presso-flessione retta/deviata) vengono eseguite le verifiche per tutte le possibili combinazioni e solo a seguito di ciò si individua quella che ha originato il minimo coefficiente di sicurezza.

Una volta semiprogettate le armature allo SLU, si procede alla verifica delle sezioni allo SLE con le sollecitazioni derivanti dalle combinazioni rare, frequenti e quasi permanenti. Successivamente si procede alle verifiche alla deformazione, quando richiesto, ed alla fessurazione che, come è noto, sono tese ad assicurare la durabilità dell'opera nel tempo.

### **7.1 VERIFICHE A STATO LIMITE ULTIMO**

#### **7.1.1 Verifiche a presso-flessione**

La determinazione della capacità resistente a flessione/presso-flessione della generica sezione viene effettuata con i criteri di cui al punto 4.1.2.1.2.4 delle NTC18, secondo quanto riportato schematicamente in figura, tenendo conto dei valori delle resistenze e deformazioni di calcolo riportate al paragrafo dedicato alle caratteristiche dei materiali.

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

Schema di riferimento per la valutazione della capacità resistente a pressoflessione generica sezione

La verifica consisterà nel controllare il soddisfacimento della seguente condizione:

$$M_{Rd} = M_{Rd}(N_{Ed}) \geq M_{Ed}$$

dove

- $M_{Rd}$  è il valore di calcolo del momento resistente corrispondente a  $N_{Ed}$ ;
- $N_{Ed}$  è il valore di calcolo della componente assiale (sforzo normale) dell'azione;
- $M_{Ed}$  è il valore di calcolo della componente flettente dell'azione.

In particolare, per il progetto degli elementi in c.a. (piedritti e fondazione) viene ipotizzata un'armatura iniziale che rispetti i minimi normativi. Per tutte le coppie (N, Mx), individuate secondo la modalità precedentemente illustrata, si calcola il momento ultimo in funzione di N, quindi il coefficiente di sicurezza rapportando tale momento ultimo a Mx. Se per almeno una di queste coppie il coefficiente di sicurezza risulta inferiore a 1 si incrementa l'armatura e si ripeté il procedimento fino a che per tutte le coppie (N, Mx) il coefficiente di sicurezza risulta al più pari a 1. Nei tabulati di calcolo, per brevità, non potendo riportare una così grossa mole di dati, si riporta la coppia (N, Mx) che ha dato luogo al minimo coefficiente di sicurezza.

### 7.1.2 Verifica a taglio

La verifica allo stato limite ultimo per azioni di taglio è condotta secondo quanto prescritto dalla norma UNI EN 1992-1-1:2005, per elementi con armatura a taglio verticali.

Si fa, pertanto, riferimento ai seguenti valori della resistenza di calcolo:

- $V_{Rd,c} = \max \left\{ \left[ \frac{0.18}{\gamma_c} \cdot k \cdot (100 \cdot \rho_1 \cdot f_{ck})^{1/3} + 0.15 \cdot \sigma_{cp} \right] \cdot b_w \cdot d; (v_{\min} + 0.15 \cdot \sigma_{cp}) \cdot b_w \cdot d \right\}$ ,

resistenza di calcolo dell'elemento privo di armatura a taglio

- $V_{Rd,s} = 0.9 \cdot \frac{A_{sw}}{s} \cdot z \cdot f_{ywd} \cdot (\cot \alpha + \cot \vartheta) \cdot \sin \alpha$ , valore di progetto dello sforzo di taglio che può essere sopportato dall'armatura a taglio alla tensione di snervamento

- $V_{Rd,max} = 0.9 \cdot d \cdot b_w \cdot \alpha_c \cdot f'_{cd} (\cot\alpha + \cot\vartheta) / (1 + \cot^2 \vartheta)$ , valore di progetto del massimo sforzo di taglio che può essere sopportato dall'elemento, limitato dalla rottura delle bielle compresse.

Nelle espressioni precedenti, i simboli hanno i seguenti significati:

- $k = 1 + \sqrt{\frac{200}{d}} \leq 2$  con d in mm;
- $\rho_1 = \frac{A_{sl}}{b_w \cdot d} \leq 0.02$ ;
- $A_{sl}$  è l'area dell'armatura tesa;
- $b_w$  è la larghezza minima della sezione in zona tesa;
- $\sigma_{cp} = \frac{N_{Ed}}{A_c} < 0.2 \cdot f_{cd}$ ;
- $N_{Ed}$  è la forza assiale nella sezione dovuta ai carichi;
- $A_c$  è l'area della sezione di calcestruzzo;
- $v_{min} = 0.035 \cdot k^{3/2} \cdot f_{ck}^{1/2}$ ;
- $1 \leq \cot\vartheta \leq 2.5$  è l'inclinazione dei puntoni di calcestruzzo rispetto all'asse della trave
- $A_{sw}$  è l'area della sezione trasversale dell'armatura a taglio;
- s è il passo delle staffe;
- $f_{ywd}$  è la tensione di snervamento di progetto dell'armatura a taglio;
- $f'_{cd} = 0.5 \cdot f_{cd}$  è la resistenza ridotta a compressione del calcestruzzo d'anima;
- $\alpha_{cw} = 1$  è un coefficiente che tiene conto dell'interazione tra la tensione nel corrente compresso e qualsiasi tensione di compressione assiale.

## 7.2 VERIFICA A STATO LIMITE D'ESERCIZIO

### 7.2.1 Verifica delle tensioni in esercizio

Nel primo caso, si esegue il controllo delle tensioni nei materiali supponendo una legge costitutiva tensioni-deformazioni di tipo lineare. In particolare, si controlla la tensione massima di compressione del calcestruzzo e di trazione dell'acciaio, verificando che:

- $\sigma_c < 0.60 f_{ck}$  per combinazione rara delle azioni;
- $\sigma_c < 0.45 f_{ck}$  per combinazione quasi permanenti;

- $\sigma_s < 0.80 f_{yk}$  .

### 7.2.2 Verifica di fessurazione

La verifica a fessurazione è stata svolta secondo il metodo proposto della NTC 2018. La verifica di fessurazione consiste nel controllare l'ampiezza dell'apertura delle fessure sotto combinazione di carico frequente e combinazione quasi permanente. In relazione all'aggressività ambientale e alla sensibilità dell'acciaio, l'apertura limite delle fessure è riportata nel prospetto seguente:

Tab. 4.1.IV - Criteri di scelta dello stato limite di fessurazione

Gruppi di Esigenze	Condizioni ambientali	Combinazione di azioni	Armatura			
			Sensibile		Poco sensibile	
			Stato limite	$w_k$	Stato limite	$w_k$
A	Ordinarie	frequente	apertura fessure	$\leq w_2$	apertura fessure	$\leq w_3$
		quasi permanente	apertura fessure	$\leq w_1$	apertura fessure	$\leq w_2$
B	Aggressive	frequente	apertura fessure	$\leq w_1$	apertura fessure	$\leq w_2$
		quasi permanente	decompressione	-	apertura fessure	$\leq w_1$
C	Molto aggressive	frequente	formazione fessure	-	apertura fessure	$\leq w_1$
		quasi permanente	decompressione	-	apertura fessure	$\leq w_1$

In questo caso si assume che le condizioni ambientali del sito in cui sorge l'opera siano ordinarie.

Si verifica che il valore limite di apertura della fessura, calcolato per armature poco sensibili, sia al più pari ai seguenti valori nominali (frequente:  $w_3=0.4$  mm; quasi permanente:  $w_2=0.3$  mm). In favore di sicurezza si adottano i seguenti valori:

- $w_2 = 0.3$  mm                      combinazione frequente
- $w_1 = 0.2$  mm                      combinazione quasi permanente

## 8 CRITERI DI VERIFICA (GEO)

### 8.1 VERIFICA A CARICO LIMITE

Per la verifica della capacità portante delle fondazioni superficiali si è fatto ricorso alla teoria di Meyerhof secondo la quale, il carico limite di una fondazione superficiale, è valutabile attraverso le seguenti espressioni:

$$Q_{lim} = c \cdot N_c \cdot s_c \cdot d_c + \gamma_1 \cdot D \cdot N_q \cdot s_q \cdot d_q + \frac{1}{2} \gamma_2 \cdot B \cdot N_\gamma \cdot s_\gamma \cdot d_\gamma \quad (\text{Caso di Carico Verticale})$$

$$Q_{lim} = c \cdot N_c \cdot d_c \cdot i_c + \gamma_1 \cdot D \cdot N_q \cdot d_q \cdot i_q + \frac{1}{2} \gamma_2 \cdot B \cdot N_\gamma \cdot d_\gamma \cdot i_\gamma \quad (\text{Caso di Carico Inclinato})$$

Dove:

$\gamma_2$  = peso di volume dello strato di fondazione;

$\gamma_w$  = peso di volume falda

$h_w$  = quota falda rispetto al piano di posa della fondazione

$e$  = eccentricità del carico rispetto al baricentro della fondazione

$B'$  = larghezza efficace della fondazione  $B' = B - 2e$

$L'$  = lunghezza efficace della fondazione  $L' = L - 2e$ ;

$c$  = coesione efficace dello strato di fondazione;

$N_c, N_q, N_\gamma$  = fattori di capacità portante;

$s_c, s_q, s_\gamma$  = fattori di forma della fondazione;

$d_c, d_q, d_\gamma$  = fattori di profondità del piano di posa della fondazione.

$i_c, i_q, i_\gamma$  = fattori di inclinazione del carico;

Il termine  $\gamma_1 D$  corrisponde al valore della pressione efficace sul piano di appoggio della fondazione che, nel caso più generale di falda tra piano campagna e piano di posa fondazione, corrisponde a:

$$\gamma_1 h_w + \gamma_1 (D - h_w)$$

con la specifica che, in tal caso, alla formula trinomia va aggiunto l'ulteriore termine:

$$\gamma_w h_w$$

Allo stesso modo, per falda presente nel volume di terreno potenzialmente interessato dal meccanismo di rottura, il  $\gamma_2$  del terzo termine della trinomia corrisponde al peso di volume efficace del terreno di fondazione  $\gamma_2'$ .

Per la teoria di Meyerhof i coefficienti sopra definiti assumono le espressioni che seguono:

$$N_c = (N_q - 1) \cdot \text{ctg } \phi; \quad N_q = \text{tg}^2 \left( 45^\circ + \frac{\phi}{2} \right) \cdot e^{(\pi \cdot \text{tg } \phi)}; \quad N_\gamma = (N_q - 1) \cdot \text{tg} (1.4 \cdot \phi)$$

$$s_c = 1 + 0.2 \cdot Kp \cdot \frac{B}{L}; \quad s_q = 1 + 0.1 \cdot \text{tg}^2 \left( 45^\circ + \frac{\phi}{2} \right) \cdot \frac{B}{L}; \quad s_{\gamma q} = s_q$$

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

$$d_c = 1 + 0.2 \cdot \operatorname{tg}\left(45^\circ + \frac{\phi}{2}\right) \cdot \frac{D}{B_f}; \quad d_q = 1 + 0.1 \cdot \operatorname{tg}\left(45^\circ + \frac{\phi}{2}\right) \cdot \frac{D}{B_f}; \quad d_\gamma = d_q$$

$$i_c = \left(1 - \frac{\theta^\circ}{90^\circ}\right)^2; \quad i_q = i_c; \quad i_\gamma = \left(1 - \frac{\theta^\circ}{\phi^\circ}\right)^2$$

Nelle espressioni di cui sopra sono stati considerati i seguenti dati:

f= angolo di attrito dello strato di fondazione;

q= inclinazione della risultante sulla verticale;

D = profondità della fondazione.

\*\* nel caso di terreno eminentemente coesivo ( $\phi = 0$ ) si assume:  $s_q = 1$ ;  $s_\gamma = 1$ ;  $d_q = 1$ ;  $d_\gamma = 1$ ;  $i_\gamma = 0$

## 9 CODICE DI CALCOLO PER I POZZETTI

Il seguente paragrafo descrive i codici di calcolo automatico per il calcolo e la verifica delle strutture ed il modello agli elementi finiti utilizzato per la valutazione delle sollecitazioni.

La ricerca dei parametri di sollecitazione è fatta secondo le disposizioni di carico più gravose, avvalendosi di codici di calcolo automatico per l'analisi strutturale.

Tutti i codici di calcolo automatico utilizzati per il calcolo e la verifica delle strutture sono di sicura ed accertata validità e sono impiegati conformemente alle loro caratteristiche.

Per i calcoli e le modellazioni di cui alla presente relazione sono impiegati i codici di calcolo brevemente descritti di seguito.

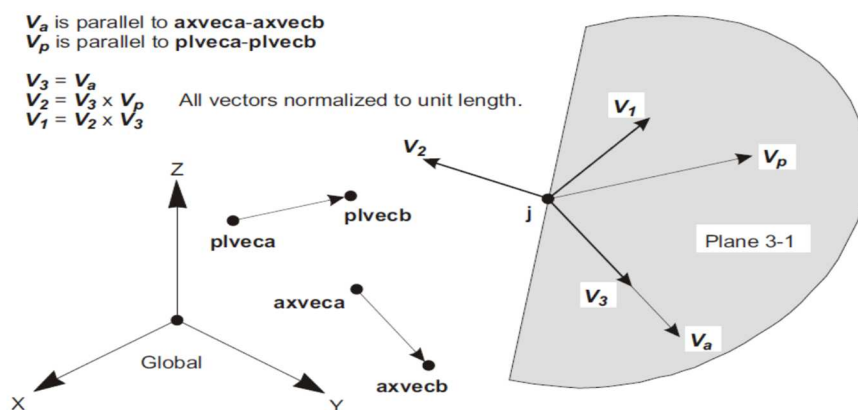

- SAP2000, prodotto dalla "CSI Computer and Structures Inc." – Berkeley (CA) – USA ;  
Codice di calcolo F.E.M. (Finite Element Method) capace di gestire il calcolo e le verifiche delle strutture miste acciaio-calcestruzzo durante tutte le fasi realizzative.

### 9.1 DESCRIZIONE DEL PROGRAMMA

Il programma è un solutore agli E.F. (Elementi Finiti) capace di modellare strutture di forma qualunque, comunque caricate e vincolate, nell'ambito del comportamento lineare e non.

Sono disponibili i seguenti tipi di oggetto elencati in ordine di dimensione geometrica:

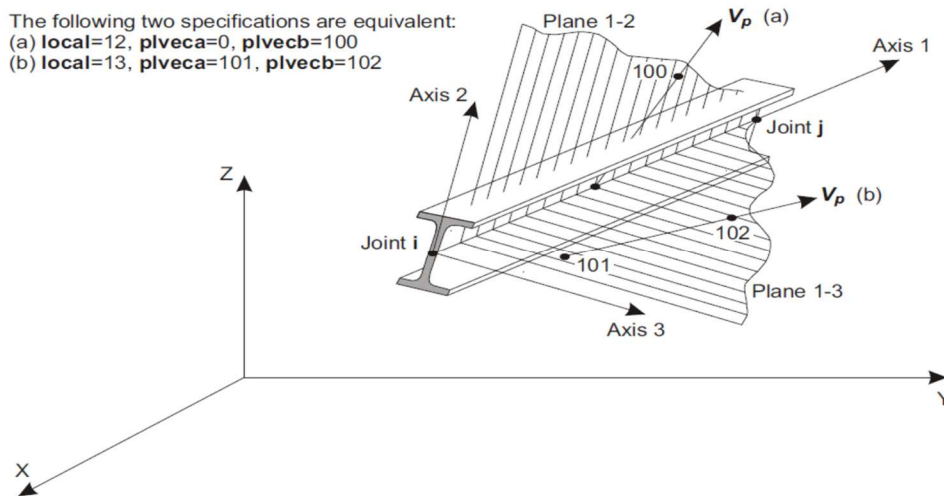

- "Point:
  - comune oggetti: sono automaticamente creati in angoli o estremità di tutti gli altri tipi di oggetti, e possono essere aggiunti in modo esplicito
  - collegamento a terra: sono utilizzate per modellare il comportamento di un sostegno speciale ad esempio isolatori, smorzatori, gap, molle multi-lineari
  - il sistema di riferimento per determinare l'orientamento di un elemento punto è:

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

- "Line":
  - frame/cable/tendon: sono utilizzate per modellare le travi, colonne, braces, trusses, cavi e tiranti
  - collegamento tra oggetti: sono utilizzate per modellare il comportamento di un membro speciali ad esempio isolatori, smorzatori, gap, molle multi-lineari. A differenza degli oggetti o frame/cable/tendon, questi oggetti possono avere lunghezza zero.
  - il sistema di riferimento per determinare l'orientamento di un elemento linea è:

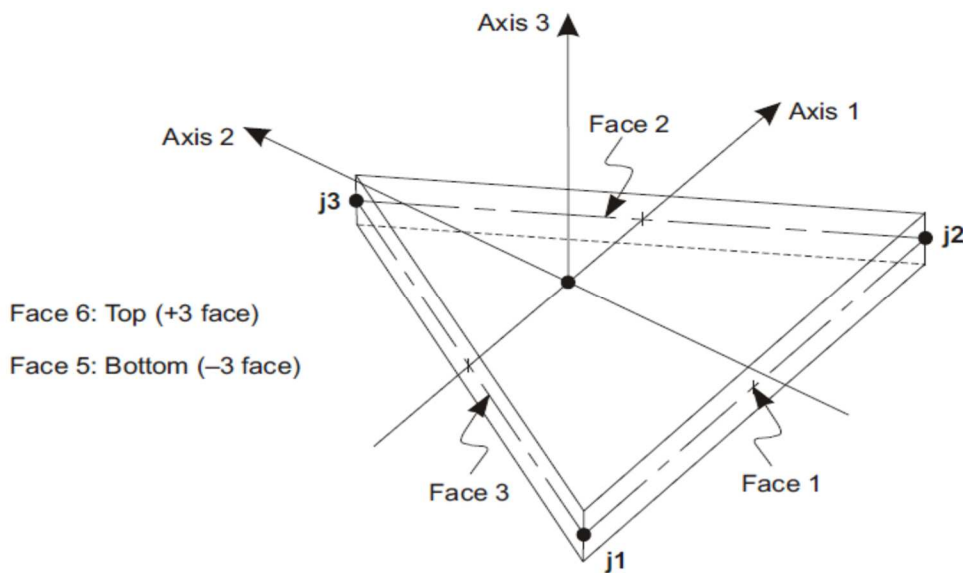

- "Area": vengono utilizzate per modellare le pareti, pavimenti e altri membri dotati di spessore, nonché solidi bidimensionale solids (plane stress, plane strain, and axisymmetric solids). Il sistema di riferimento per determinare l'orientamento di un elemento area è:

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

Four-node Quadrilateral Shell Element

Three-node Triangular Shell Element

- **"Solid"**: sono utilizzate per la modellazione tridimensionale solida

Il programma SAP2000 permette di svolgere analisi atte a definire la risposta in conseguenza dell'applicazione di carichi mobili, analisi del dominio di frequenza (sia steady-state che power-spectral-density), del dominio del tempo e analisi di instabilità.

Mediante il programma si possono implementare nel modello di calcolo elementi a comportamento particolare quali:

- non linear link element (gaps, hooks, isolators, dampers, and multi-linear plasticity)
- a multi-linear plastic hinge
- catenary cable element
- nonlinear shell element

Il programma SAP2000 permette inoltre di condurre analisi tipo non lineare statica , analisi tipo pushover e analisi non lineari tipo time-history mediante l'utilizzo di analisi modale o integrazione diretta. software contempla la presenza di elementi bidimensionali (piani - shell) in grado di rappresentare sia il comportamento di lastra (effetti flessionali) quanto quello di membrana (sforzi di compressione e trazione), ed elementi tipo trave (beam).

## 9.2 SISTEMI DI RIFERIMENTO

Il sistema di riferimento nei modelli di calcolo viene assunto con origine coincidente con lo spigolo sinistro basso della struttura schematizzata.

La disposizione degli assi segue la "regola della mano destra":

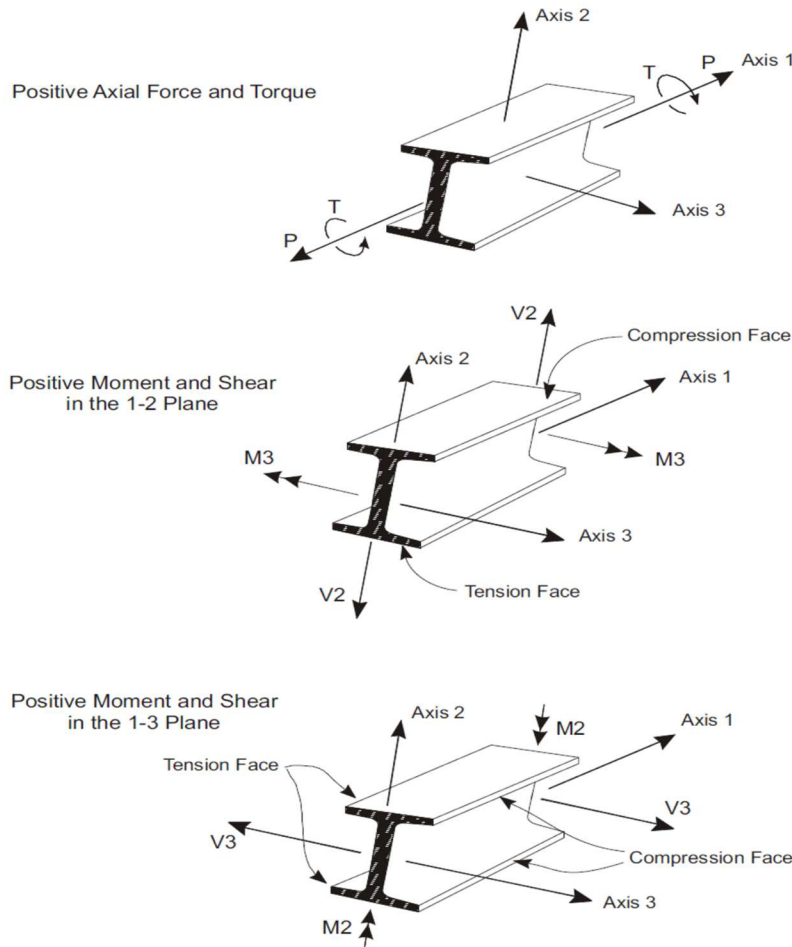

l'asse X è diretto secondo l'asse longitudinale della struttura;

l'asse Y è diretto secondo l'asse trasversale della struttura;

l'asse Z è diretto verso l'alto, positivo verso l'alto.

Si definiscono positive le azioni e sollecitazioni secondo la convenzione riportata nella figura successiva.

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

**9.3 AFFIDABILITÀ DEI CODICI DI CALCOLO**

Un attento esame preliminare della documentazione a corredo del software ha consentito di valutarne l'affidabilità. La documentazione fornita dal produttore del software contiene un'esauriente descrizione delle basi teoriche, degli algoritmi impiegati e l'individuazione dei campi d'impiego. La società produttrice Aztec Informatica srl ha verificato l'affidabilità e la robustezza del codice di calcolo attraverso un numero significativo di casi prova in cui i risultati dell'analisi numerica sono stati confrontati con soluzioni teoriche.

**9.4 MODALITÀ DI PRESENTAZIONE DEI RISULTATI**

La relazione di calcolo strutturale presenta i dati di calcolo tale da garantirne la leggibilità, la corretta interpretazione e la riproducibilità. La relazione di calcolo illustra in modo esaustivo i dati in ingresso ed i risultati delle analisi in forma tabellare.

**9.5 INFORMAZIONI GENERALI SULL'ELABORAZIONE**

Il software prevede una serie di controlli automatici che consentono l'individuazione di errori di modellazione, di non rispetto di limitazioni geometriche e di armatura e di presenza di elementi non

verificati. Il codice di calcolo consente di visualizzare e controllare, sia in forma grafica che tabellare, i dati del modello strutturale, in modo da avere una visione consapevole del comportamento corretto del modello strutturale.

#### **9.6 GIUDIZIO MOTIVATO DI ACCETTABILITÀ DEI RISULTATI**

I risultati delle elaborazioni sono stati sottoposti a controlli dal sottoscritto utente del software. Tale valutazione ha compreso il confronto con i risultati di semplici calcoli, eseguiti con metodi tradizionali. Inoltre, sulla base di considerazioni riguardanti gli stati tensionali e deformativi determinati, si è valutata la validità delle scelte operate in sede di schematizzazione e di modellazione della struttura e delle azioni. In base a quanto sopra, si asserisce che l'elaborazione è corretta ed idonea al caso specifico, pertanto i risultati di calcolo sono da ritenersi validi ed accettabili.

## **10 CODICE DI CALCOLO PER IL TOMBINO**

Nell'ambito del presente paragrafo si riporta una descrizione delle caratteristiche dei Software utilizzati per l'effettuazione delle Analisi e Verifiche strutturali e geotecniche esposte nel presente documento.

### **Denominazione ed Estremi di Licenza del Software**

Titolo SCAT - Analisi Strutture Scatolari  
Versione 11.0  
Produttore Aztec Informatica srl, Casole Bruzio (CS)  
Utente TECNOSTRUTTURE S.R.L.  
Licenza AIU3163LJ

#### **10.1 TIPO DI ANALISI SVOLTA**

L'analisi strutturale e le verifiche sono condotte con l'ausilio di un codice di calcolo automatico. La verifica della sicurezza degli elementi strutturali è stata valutata con i metodi della scienza delle costruzioni.

La struttura viene discretizzata in elementi tipo trave. Per simulare il comportamento del terreno di fondazione e di rinfianco vengono inserite delle molle alla Winkler non reagenti a trazione

L'analisi che viene effettuata è un'analisi al passo per tener conto delle molle che devono essere eliminate (molle in trazione). L'analisi fornisce i risultati in termini di spostamenti. Dagli spostamenti si risale alle sollecitazioni nodali ed alle pressioni sul terreno.

Il calcolo degli scatolari viene eseguito secondo le seguenti fasi:

- Calcolo delle pressioni in calotta (per gli scatolari ricoperti da terreno);
- Calcolo della spinta del terreno;
- Calcolo delle sollecitazioni sugli elementi strutturali (fondazione, piedritti e traverso);
- Progetto delle armature e relative verifiche dei materiali.

L'analisi strutturale sotto le azioni sismiche è condotta con il metodo dell'analisi statica equivalente

La verifica delle sezioni degli elementi strutturali è eseguita con il metodo degli Stati Limite. Le combinazioni di carico adottate sono esaustive relativamente agli scenari di carico più gravosi cui l'opera sarà soggetta.

#### **10.2 AFFIDABILITÀ DEI CODICI DI CALCOLO**

Un attento esame preliminare della documentazione a corredo dei software impiegati ha consentito di valutarne l'affidabilità. La documentazione fornita dal produttore dei software contiene un'esauriente descrizione delle basi teoriche, degli algoritmi impiegati e l'individuazione dei campi d'impiego. Le stesse società produttrici hanno verificato l'affidabilità e la robustezza del codice di calcolo attraverso un numero significativo di casi prova in cui i risultati sono contenuti in apposita documentazione fornita a corredo dell'acquisto del prodotto, che per brevità espositiva si omette di allegare al presente documento.

### **10.3 GIUDIZIO MOTIVATO DI ACCETTABILITÀ DEI RISULTATI**

I risultati delle elaborazioni esposte nel documento sono stati inoltre sottoposti a controlli dal sottoscritto utente del software.

Tale valutazione ha compreso il confronto con i risultati di semplici calcoli, eseguiti con metodi tradizionali, che per brevità espositiva si omette dall'allegare al presente documento.

Inoltre, sulla base di considerazioni riguardanti gli stati tensionali e deformativi determinati, si è valutata la validità delle scelte operate in sede di schematizzazione e di modellazione della struttura e delle azioni.

In base a quanto sopra, Il Progettista dichiara pertanto che l'elaborazione è corretta ed idonea al caso specifico, validando conseguentemente i risultati dei calcoli esposti nella presente

# POZZETTO TIPO 1

## 11 ANALISI DEI CARICHI

L'analisi viene condotta considerando una larghezza unitaria dell'opera.

### 11.1 PESI PROPRI

Il peso proprio dei permanenti (strutture in c.a.) è pari a:

$$\gamma = 25 \text{ kN/m}^3 \quad \text{Pesi propri della struttura}$$

### 11.2 AZIONE STATICA

#### 11.2.1 Spinta del terreno

Sulle pareti, in esercizio, viene presa in considerazione la spinta del terreno a riposo.

$$P_{\text{testa}} = Q_{\text{perm}} * K_0 + K_0 * \gamma * h_s = 0.00 \text{ kN/m}^2 \quad \text{Testa muro}$$

$$P_{\text{q.falda}} = P_{\text{testa}} + k_0 * \gamma * h_{\text{falda}} = 0.00 + 0.625 * 19 * 2 = 23.75 \text{ kN/m}^2 \quad \text{Quota falda (H=2.00 m)}$$

$$P_{\text{piede}} = P_{\text{q.falda}} + K_0 * (\gamma_{\text{sat}} - \gamma_w) * (h_s - h_{\text{falda}}) + \gamma_w * (h_s - h_{\text{falda}}) = 23.75 + 0.625 * (20 - 10) * (7.55 - 2) + 10 * (7.55 - 2) = 90.19 \text{ kN/m}^2$$

Asse fondazione

Dove:

$$\gamma = 19 \text{ kN/m}^3$$

$$\gamma_{\text{sat}} = 20 \text{ kN/m}^3$$

$$k_0 = 1 - \sin \phi' = 0.625, \text{ con } \phi' = 22^\circ$$

$$h_s = 7.55 \text{ m}$$

$$h_{\text{falda}} = 2.00 \text{ m}$$

#### 11.2.2 Spinta dell'accidentale a tergo del muro

Sulle pareti, in esercizio, viene presa in considerazione di un sovraccarico dovuto ai mezzi di lavoro pari a  $10 \text{ kN/m}^2$ .

$$P_q = Q_{\text{sov}} * K_0 = 10 * 0.625 = 6.25 \text{ kN/m}^2$$

### 11.3 AZIONE SISMICA

#### 11.3.1 Incremento di spinta del terreno

La valutazione della spinta del terreno in zona sismica, secondo quanto prevede il D.M 17 gennaio 2018 "Norme tecniche per le Costruzioni" al § 3.2.3 e al § 7.11.6.2.1, è stata eseguita utilizzando metodi *pseudo-statici*. L'utilizzo di metodi pseudo-statici consente di ricondurre l'azione sismica, che è un'azione dinamica variabile nel tempo e nello spazio, ad un insieme di forze statiche equivalenti, orizzontali e verticali, mediante l'utilizzo di coefficienti sismici, che dipendono dalla zona sismica, dalle condizioni locali e

dall'entità degli spostamenti ammessi per l'opera considerata. I coefficienti sismici, orizzontale e verticale, sono rispettivamente:

$$k_h = \beta m \frac{a_{\max}}{g} = 1 * 0.363 = 0.363 \quad \text{coefficiente sismico orizzontale con } \beta m = 1$$

$$k_v = \pm 0.5 * k_h \quad \text{coefficiente sismico verticale}$$

Le spinte delle terre, considerando l'opera una struttura rigida e priva di spostamenti (par. 7.11.6.2.1 D.M. 17.01.18), sono calcolate in regime di spinta a riposo che comporta il calcolo delle spinte sismiche in tali condizioni. Per il calcolo dell'incremento di spinta sismica si è seguita la formulazione di WOOD:

$$\Delta S = \frac{a_g}{g} \cdot S \cdot \gamma \cdot h_s = 0.363 * 19 * 7.55 = 52.07 \text{ kN/m}^2 \quad \text{incremento di spinta uniformem. distribuito sul ritto}$$

### **11.3.2 Forze di inerzia**

L'azione sismica è rappresentata da un insieme di forze statiche orizzontali e verticali, date dal prodotto delle forze di gravità per i coefficienti sismici in precedenza definiti. Visto il modello di calcolo a piastra verticale, la componente sismica verticale perde di significato pertanto viene trascurata.

Oltre a questo incremento di spinta bisogna tenere conto delle forze orizzontali d'inerzia  $F_i$  delle masse strutturali, includendo in esse anche la massa del terreno stabilizzante a tergo del paramento:

$$F_i = k_h W \quad \text{con } k_h \text{ sopra definito.}$$

Queste forze vengono calcolate in automatico dal codice di calcolo introducendo dei moltiplicatori gravitazionali di valore pari a  $K_h$ .

#### 11.4 COMBINAZIONI DI CARICO

Di seguito vengono riportate le combinazioni di carico elementari e i coefficienti relativi a tali combinazioni.

<b>TABLE: Combination Definitions</b>

## 12 RISULTATI, ANALISI E VERIFICHE

### 12.1 MODELLO DI CALCOLO

In relazione a quanto anticipato in premessa, è stato individuato per la tipologia di pozzetto 1 il seguente schema di calcolo:

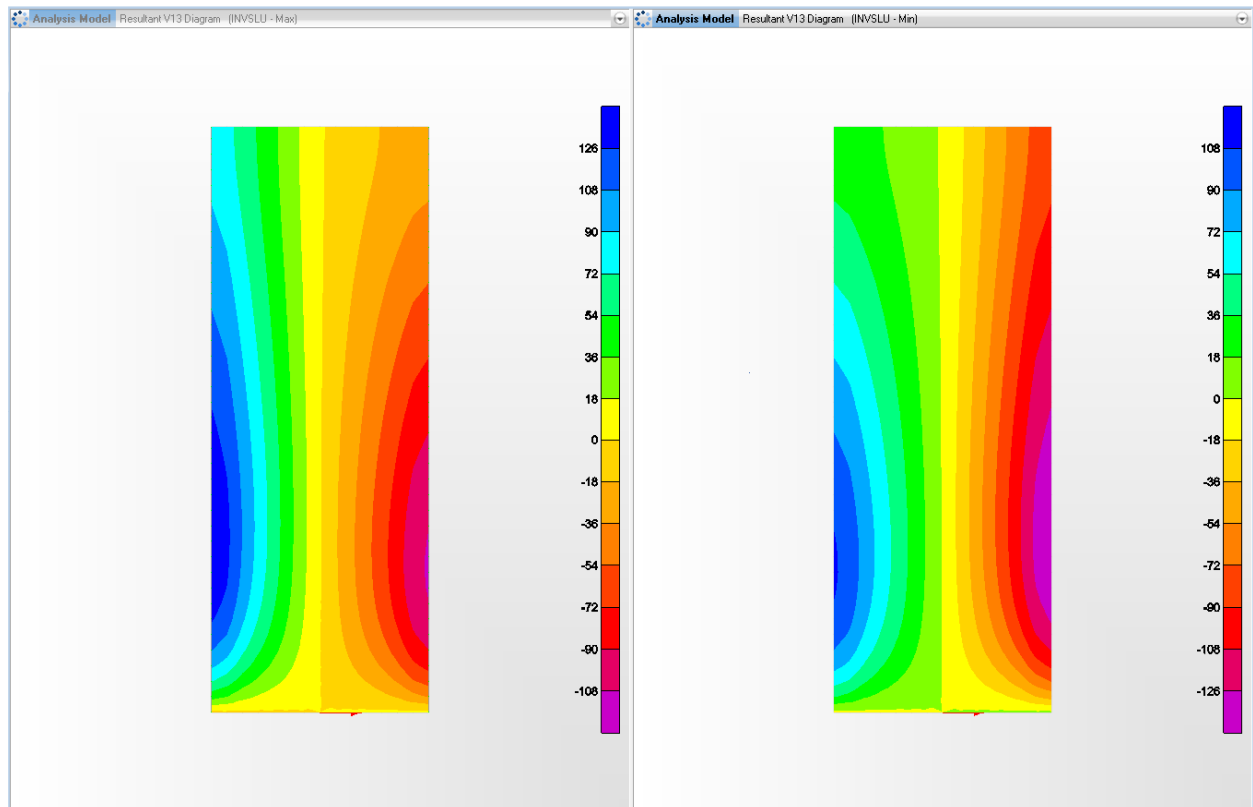

Parete incastrata in asse fondazione, in asse pareti laterali e libera in testa.

Lo schema statico adottato prevede elementi "shell" di dimensioni max 20x20 cm e spessore pari a 30 cm incastrati ai lati e in fondazione.

## 12.2 SOLLECITAZIONI DI CALCOLO

### 12.2.1 Stato limite ultimo

Di seguito vengono riportate l'andamento delle sollecitazioni interne per l'involuppo delle combinazioni di carico considerate.

Involuppo SLU: Taglio V13 (max a sx e min a dx)

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

Inviluppo SLU: Taglio V23 (max a sx e min a dx)

COMB. QUASI PERM.	38.92	32.55	76.12	73.37

**12.3 ARMATURE DI PROGETTO**

Di seguito si riassumono le caratteristiche geometriche (Larghezza della sezione B e altezza della sezione H) e le armature assunte per il dimensionamento dei principali elementi strutturali (numero, diametro e posizione delle barre previste per l'elemento di lunghezza unitaria).

Dato che le sollecitazioni nelle due direzioni hanno lo stesso ordine di grandezza, le verifiche vengono condotte con le sole sollecitazioni massime, disponendo la stessa armatura longitudinale e trasversale.

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

Larghezza	<b>b</b>	100 cm
Altezza	<b>h</b>	30 cm
Armatura tesa 1° strato	<b>A<sub>a</sub></b>	1Φ14/12.5 = 12.32 cm <sup>2</sup>
Copriferro 1°strato	<b>c<sub>1</sub></b>	6.1 cm
Armatura Compressa	<b>A'<sub>a</sub></b>	1Φ12/25 = 4.52 cm <sup>2</sup>
Copriferro armatura compressa	<b>c'</b>	5.8 cm

*Caratteristiche geometriche della sezione*

Le sollecitazioni per l'acciaio sono state ottenute trascurando, a favore di sicurezza, le azioni normali di compressione.

#### 12.4 RISULTATI VERIFICHE (STR)

Di seguito vengono riportati i risultati delle verifiche strutturali, nelle sezioni di calcolo riportate nello schema delle armature per ogni sezione di calcolo, in forma tabellare esplicitate nell'allegato:

Le verifiche strutturali saranno condotte secondo DM 17 gennaio 2018 utilizzando i coefficienti parziali riportati nelle tabella precedente per le azioni.

##### 12.4.1 Verifiche allo SLU

Nel seguente paragrafo si riportano le verifiche a pressoflessione e a taglio.

###### 12.4.1.1 Verifica a flessione

Si mostrano, nelle seguenti tabelle, le verifiche SLU nei confronti della flessione. Si riportano per semplicità le verifiche più gravose per la struttura.

Inviluppo SLU

N.Sez	B [cm]	H [cm]	M [kNm]	M <sub>RD</sub> [kNm]	F <sub>s,momento</sub>	Verifica
<b>1</b>	100	30	74.19	128.90	1.74	<b>SI</b>

La verifica risulta soddisfatta.

###### 12.4.1.2 Verifica a taglio

I risultati ottenuti dalle verifiche delle sezioni maggiormente sollecitate (a filo pareti) per la struttura in esame sono riepilogati nella seguente tabella.

Inviluppo SLU

N.Sez	B [cm]	H [cm]	V <sub>Ed</sub> [kN]	V <sub>RSd</sub> * [kN]	V <sub>Rcd</sub> [kN]	F <sub>s,taglio</sub>	Verifica
-------	--------	--------	----------------------	-------------------------	-----------------------	-----------------------	----------

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

1	100	30	144.20	178.28	-	1.24	SI
---	-----	----	--------	--------	---	------	----

\* la resistenza a taglio  $V_{Rsd}$  è stata calcolata utilizzando il traliccio ad inclinazione variabile secondo quanto riportato nelle NTC08.

In tutte le sezioni la resistenza a taglio è garantita dal solo calcestruzzo.

#### 12.4.2 Verifiche allo SLE

Nel seguente paragrafo si riportano le verifiche allo stato limite di apertura delle fessure e le verifiche delle tensioni per il calcestruzzo e per l'acciaio di armatura.

##### 12.4.2.1 Verifica delle tensioni

Nelle tabelle seguenti sono riportati i risultati delle verifiche allo SLE dei limiti tensionali di lavoro nel calcestruzzo e nelle barre di armatura.

La verifica fornisce i seguenti risultati:

##### Combinazione SLE rara

N. Sez.	B [cm]	H [cm]	$M_{ed}$ [kNm]	$\sigma_c$ [Mpa] $\sigma_c < 0.6 \cdot f_{ck}$	$\sigma_f$ [Mpa] $\sigma_f < 0.8 \cdot f_{yk}$	Verifica
1	100	30	46.45	18.26	337.50	SI

Nello specifico si verifica che le tensioni nei materiali si mantengano nei seguenti limiti:

C32/40  $\sigma_c \leq 0.60 f_{ck} = 0.60 \cdot 32 = 19.20 \text{ N/mm}^2$

B450C  $\sigma_f \leq 0.80 f_{yk} = 360 \text{ N/mm}^2$

##### Combinazione SLE quasi permanente

N. Sez.	B [cm]	H [cm]	$M_{ed}$ [kNm]	$\sigma_c$ [Mpa] $\sigma_c < 0.45 \cdot f_{ck}$	$\sigma_f$ [Mpa] $\sigma_f < 0.8 \cdot f_{yk}$	Verifica
1	100	30	38.92	4.53		SI

Nello specifico si verifica che le tensioni nei materiali si mantengano nei seguenti limiti:

C32/40  $\sigma_c \leq 0.45 f_{ck} = 0.60 \cdot 32 = 14.94 \text{ N/mm}^2$

B450C  $\sigma_f \leq 0.80 f_{yk} = 360 \text{ N/mm}^2$

Tali tensioni risultano sempre al di sotto dei limiti indicati dalla normativa, pertanto, le verifiche si possono ritenere soddisfatte. Vengono riportate le verifiche più gravose.

#### 12.4.2.2 Verifica a fessurazione

Per la verifica a fessurazione si considerano le sollecitazioni relative alla Combinazione Frequente e Quasi Permanente.

I relativi valori di ampiezza delle fessure ricavati per la combinazione Frequente e Quasi Permanente sono riportati in Tabella:

##### Combinazione SLE frequente

N. Sez.	B [cm]	H [cm]	M <sub>ed</sub> [kNm]	w <sub>k</sub> [mm] w <sub>k</sub> < 0.3	Verifica
<b>1</b>	100	30	44.57	0.173	<b>SI</b>

##### Combinazione SLE quasi permanente

N. Sez.	B [cm]	H [cm]	M <sub>ed</sub> [kNm]	w <sub>k</sub> [mm] w <sub>k</sub> < 0.2	Verifica
<b>1</b>	100	30	44.57	0.151	<b>SI</b>

L'ampiezza delle fessure è sempre al di sotto dei limiti previsti da normativa, pertanto, le verifiche si possono ritenere soddisfatte.

# POZZETTO TIPO 2

## 13 ANALISI DEI CARICHI

L'analisi viene condotta considerando una larghezza unitaria dell'opera.

### 13.1 PESI PROPRI

Il peso proprio dei permanenti (strutture in c.a.) è pari a:

$$\gamma = 25 \text{ kN/m}^3 \quad \text{Pesi propri della struttura}$$

### 13.2 AZIONE STATICA

#### 13.2.1 Spinta del terreno

Sulle pareti, in esercizio, viene presa in considerazione la spinta del terreno a riposo.

$$P_{\text{testa}} = Q_{\text{perm}} * K_0 + K_0 * \gamma * h_s = 0.00 \text{ kN/m}^2 \quad \text{Testa muro}$$

$$P_{\text{q.falda}} = P_{\text{testa}} + k_0 * \gamma * h_{\text{falda}} = 0.00 + 0.625 * 19 * 2 = 23.75 \text{ kN/m}^2 \quad \text{Quota falda (H=2.00 m)}$$

$$P_{\text{piede,sx}} = P_{\text{q.falda}} + K_0 * (\gamma_{\text{sat}} - \gamma_w) * (h_s - h_{\text{falda}}) + \gamma_w * (h_s - h_{\text{falda}}) = 23.75 + 0.625 * (20 - 10) * (5.55 - 2) + 10 * (5.55 - 2) = 81.44 \text{ kN/m}^2 \quad \text{Asse fondazione spigolo sx}$$

$$P_{\text{piede,dx}} = P_{\text{q.falda}} + K_0 * (\gamma_{\text{sat}} - \gamma_w) * (h_s - h_{\text{falda}}) + \gamma_w * (h_s - h_{\text{falda}}) = 0.00 + 0.625 * (20 - 10) * 1.35 + 10 * 1.35 = 21.94 \text{ kN/m}^2 \quad \text{Asse fondazione spigolo dx}$$

Dove:

$$\gamma = 19 \text{ kN/m}^3$$

$$\gamma_{\text{sat}} = 20 \text{ kN/m}^3$$

$$k_0 = 1 - \sin \phi' = 0.625, \text{ con } \phi' = 22^\circ$$

$$h_s = 5.55 \text{ m}$$

$$h_{\text{falda}} = 2.00 \text{ m}$$

#### 13.2.2 Spinta dell'accidentale a tergo del muro

Sulle pareti, in esercizio, viene presa in considerazione di un sovraccarico dovuto ai mezzi di lavoro pari a 10 kN/m<sup>2</sup>.

$$P_q = Q_{\text{sov}} * K_0 = 10 * 0.625 = 6.25 \text{ kN/m}^2$$

### 13.3 AZIONE SISMICA

#### 13.3.1 Incremento di spinta del terreno

La valutazione della spinta del terreno in zona sismica, secondo quanto prevede il D.M 17 gennaio 2018 "Norme tecniche per le Costruzioni" al § 3.2.3 e al § 7.11.6.2.1, è stata eseguita utilizzando metodi *pseudo-statici*. L'utilizzo di metodi pseudo-statici consente di ricondurre l'azione sismica, che è un'azione dinamica variabile nel tempo e nello spazio, ad un insieme di forze statiche equivalenti, orizzontali e verticali,

mediante l'utilizzo di coefficienti sismici, che dipendono dalla zona sismica, dalle condizioni locali e dall'entità degli spostamenti ammessi per l'opera considerata. I coefficienti sismici, orizzontale e verticale, sono rispettivamente:

$$k_h = \beta m \frac{a_{\max}}{g} = 1 * 0.363 = 0.363 \quad \text{coefficiente sismico orizzontale con } \beta m = 1$$

$$k_v = \pm 0.5 * k_h \quad \text{coefficiente sismico verticale}$$

Le spinte delle terre, considerando l'opera una struttura rigida e priva di spostamenti (par. 7.11.6.2.1 D.M. 11.01.18), sono calcolate in regime di spinta a riposo che comporta il calcolo delle spinte sismiche in tali condizioni. Per il calcolo dell'incremento di spinta sismica si è seguita la formulazione di WOOD:

$$\Delta S = \frac{a_g}{g} \cdot S \cdot \gamma \cdot \frac{(h_{\max} + h_{\min})}{2} = 0.363 * 19 * \frac{5.55 + 1.35}{2} = 23.79 \text{ kN/ m}^2 \quad \text{incremento di spinta}$$

uniformemente distribuito sul ritto

### 13.3.2 Forze di inerzia

L'azione sismica è rappresentata da un insieme di forze statiche orizzontali e verticali, date dal prodotto delle forze di gravità per i coefficienti sismici in precedenza definiti. Visto il modello di calcolo a piastra verticale, la componente sismica verticale perde di significato pertanto viene trascurata.

Oltre a questo incremento di spinta bisogna tenere conto delle forze orizzontali d'inerzia  $F_i$  delle masse strutturali, includendo in esse anche la massa del terreno stabilizzante a tergo del paramento:

$$F_i = k_h W \quad \text{con } k_h \text{ sopra definito.}$$

Queste forze vengono calcolate in automatico dal codice di calcolo introducendo dei moltiplicatori gravitazionali di valore pari a  $K_h$ .

### 13.4 COMBINAZIONI DI CARICO

Di seguito vengono riportate le combinazioni di carico elementari e i coefficienti relativi a tali combinazioni.

## 14 RISULTATI, ANALISI E VERIFICHE

### 14.1 MODELLO DI CALCOLO

In relazione a quanto anticipato in premessa, è stato individuato per la tipologia di pozzetto 2 il seguente schema di calcolo:

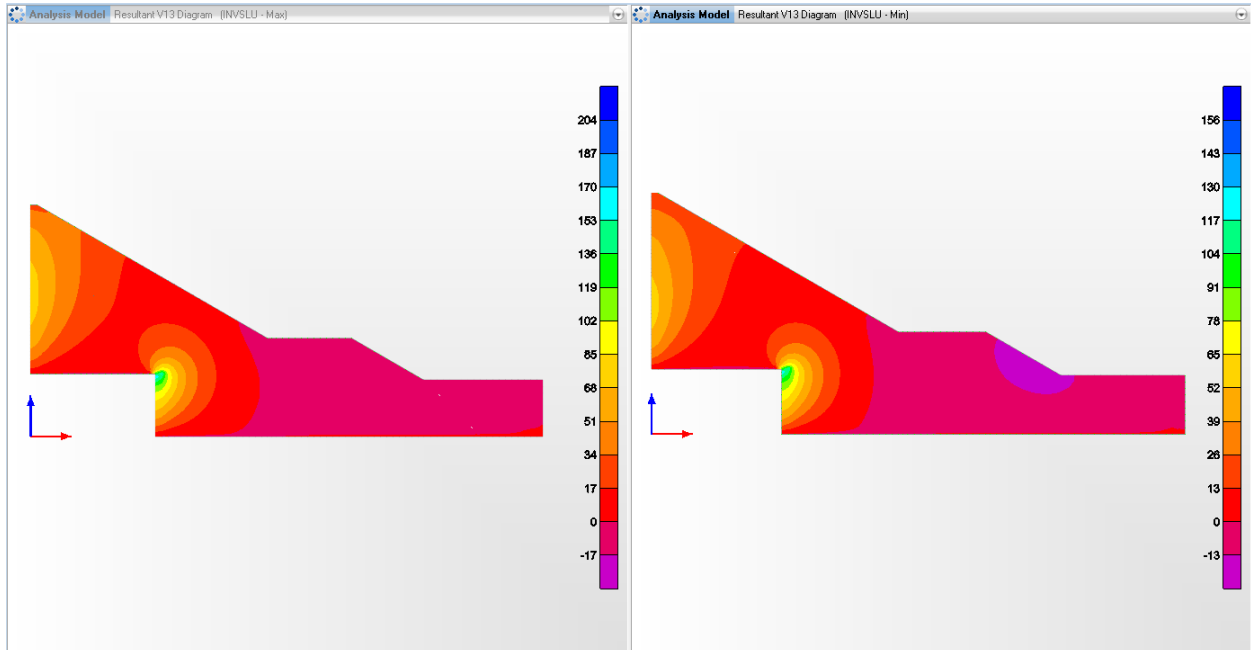

**Parete incastrata in asse fondazione, in asse di una parete laterale e libera in testa sui restanti lati.**

Lo schema statico adottato prevede elementi "shell" di dimensioni max 20x20 cm e spessore pari a 30 cm incastrati su due lati e in fondazione.

## 14.2 SOLLECITAZIONI DI CALCOLO

### 14.2.1 Stato limite ultimo

Di seguito vengono riportate l'andamento delle sollecitazioni interne per l'involuppo delle combinazioni di carico considerate.

Involuppo SLU: Taglio V13 (max a sx e min a dx)

Involuppo SLU: Taglio V23 (max a sx e min a dx)

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

Inviluppo SLU: Momenti flettenti M11 (max a sx e min a dx)

Inviluppo SLU: Momenti flettenti M22 (max a sx e min a dx)

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

I valori massimi di taglio e momento per ogni combinazione di carico considerata vengono riportati in tabella.

SLU	M11 (kNm)	M22 (kNm)	V13 (kN)	V23 (kN)
COMB. STATICA	40.94	65.13	56.23	78.46
COMB. SISMICA	64.94	<b>95.65</b>	73.60	<b>98.87</b>

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

**14.2.2 Stato limite di esercizio**

Di seguito vengono riportate l'andamento delle sollecitazioni interne per l'involuppo delle combinazioni di carico considerate.

Involuppo SLE: Taglio V13 (max a sx e min a dx)

Involuppo SLE: Taglio V23 (max a sx e min a dx)

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

Inviluppo SLE: Momenti flettenti M11 (max a sx e min a dx)

Inviluppo SLE: Momenti flettenti M22 (max a sx e min a dx)

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

I valori massimi di taglio e momento per ogni combinazione di carico considerata vengono riportati in tabella.

SLE	M11 (kNm)	M22 (kNm)	V13 (kN)	V23 (kN)
COMB. RARA	29.89	<b>47.84</b>	41.83	<b>58.46</b>
COMB. FREQUENTE	27.30	44.20	39.55	55.52
COMB. QUASI PERM.	19.97	33.35	32.92	46.73

### 14.3 ARMATURE DI PROGETTO

Di seguito si riassumono le caratteristiche geometriche (Larghezza della sezione B e altezza della sezione H) e le armature assunte per il dimensionamento dei principali elementi strutturali (numero, diametro e posizione delle barre previste per l'elemento di lunghezza unitaria).

Dato che le sollecitazioni nelle due direzioni hanno lo stesso ordine di grandezza, le verifiche vengono condotte con le sole sollecitazioni massime, disponendo la stessa armatura longitudinale e trasversale.

Larghezza	<b>b</b>	100 cm
Altezza	<b>h</b>	30 cm
Armatura tesa 1° strato	<b>A<sub>a</sub></b>	1Φ14/12.5 = 12.32 cm <sup>2</sup>
Copriferro 1° strato	<b>c<sub>1</sub></b>	6.1 cm
Armatura Compressa	<b>A'<sub>a</sub></b>	1Φ12/25 = 4.52 cm <sup>2</sup>
Copriferro armatura compressa	<b>c'</b>	5.8 cm

*Caratteristiche geometriche della sezione*

Le sollecitazioni per l'acciaio sono state ottenute trascurando, a favore di sicurezza, le azioni normali di compressione.

### 14.4 RISULTATI VERIFICHE (STR)

Di seguito vengono riportati i risultati delle verifiche strutturali, nelle sezioni di calcolo riportate nello schema delle armature per ogni sezione di calcolo, in forma tabellare.

Le verifiche strutturali saranno condotte secondo DM 17 gennaio 2018 utilizzando i coefficienti parziali riportati nelle tabella precedente per le azioni.

#### 14.4.1 Verifiche allo SLU

Nel seguente paragrafo si riportano le verifiche a flessione e a taglio.

##### 14.4.1.1 Verifica a flessione

Si mostrano, nelle seguenti tabelle, le verifiche SLU nei confronti della flessione. Si riportano per semplicità le verifiche più gravose per la struttura.

##### Inviluppo SLU

N.Sez	B [cm]	H [cm]	M [kNm]	M <sub>RD</sub> [kNm]	F <sub>s,momento</sub>	Verifica
<b>1</b>	100	30	95.65	128.90	1.35	<b>SI</b>

La verifica risulta soddisfatta.

#### 14.4.1.2 Verifica a taglio

I risultati ottenuti dalle verifiche delle sezioni maggiormente sollecitate (a filo pareti) per la struttura in esame sono riepilogati nella seguente tabella.

##### Inviluppo SLU

N.Sez	B [cm]	H [cm]	V <sub>Ed</sub> [kN]	V <sub>RSd</sub> * [kN]	V <sub>Rcd</sub> [kN]	F <sub>s,taglio</sub>	Verifica
1	100	30	98.87	178.28	-	1.80	SI

\* la resistenza a taglio V<sub>RSd</sub> è stata calcolata utilizzando il traliccio ad inclinazione variabile secondo quanto riportato nelle NTC08.

In tutte le sezioni la resistenza a taglio è garantita dal solo calcestruzzo. La verifica risulta soddisfatta.

#### 14.4.2 Verifiche allo SLE

Nel seguente paragrafo si riportano le verifiche allo stato limite di apertura delle fessure e le verifiche delle tensioni per il calcestruzzo e per l'acciaio di armatura.

##### 14.4.2.1 Verifica delle tensioni

Nelle tabelle seguenti sono riportati i risultati delle verifiche allo SLE dei limiti tensionali di lavoro nel calcestruzzo e nelle barre di armatura.

La verifica fornisce i seguenti risultati:

##### Combinazione SLE rara

N. Sez.	B [cm]	H [cm]	M <sub>ed</sub> [kNm]	σ <sub>c</sub> [Mpa] σ <sub>c</sub> < 0.6·f <sub>ck</sub>	σ <sub>f</sub> [Mpa] σ <sub>f</sub> < 0.8·f <sub>yk</sub>	Verifica
1	100	30	47.84	18.26	337.50	SI

Nello specifico si verifica che le tensioni nei materiali si mantengano nei seguenti limiti:

C32/40    σ<sub>c</sub> ≤ 0.60 f<sub>ck</sub> = 0.60·32 = 19.20 N/mm<sup>2</sup>

B450C    σ<sub>f</sub> ≤ 0.80 f<sub>yk</sub> = 0.80·450 = 360 N/mm<sup>2</sup>

##### Combinazione SLE quasi permanente

N. Sez.	B [cm]	H [cm]	M <sub>ed</sub> [kNm]	σ <sub>c</sub> [Mpa] σ <sub>c</sub> < 0.45·f <sub>ck</sub>	σ <sub>f</sub> [Mpa] σ <sub>f</sub> < 0.8·f <sub>yk</sub>	Verifica
1	100	30	33.35	4.53		SI

Nello specifico si verifica che le tensioni nei materiali si mantengano nei seguenti limiti:

C32/40    σ<sub>c</sub> ≤ 0.45 f<sub>ck</sub> = 0.45·33.20 = 14.94 N/mm<sup>2</sup>

B450C    σ<sub>f</sub> ≤ 0.80 f<sub>yk</sub> = 360 N/mm<sup>2</sup>

Tali tensioni risultano sempre al di sotto dei limiti indicati dalla normativa, pertanto, le verifiche si possono ritenere soddisfatte. Vengono riportate le verifiche più gravose.

#### 14.4.2.2 Verifica a fessurazione

Per la verifica a fessurazione si considerano le sollecitazioni relative alla Combinazione Frequente e Quasi Permanente.

I relativi valori di ampiezza delle fessure ricavati per la combinazione Frequente e Quasi Permanente sono riportati in Tabella:

##### Combinazione SLE frequente

N. Sez.	B [cm]	H [cm]	M <sub>ed</sub> [kNm]	w <sub>k</sub> [mm] w <sub>k</sub> < 0.3	Verifica
1	100	30	44.20	0.172	SI

##### Combinazione SLE quasi permanente

N. Sez.	B [cm]	H [cm]	M <sub>ed</sub> [kNm]	w <sub>k</sub> [mm] w <sub>k</sub> < 0.2	Verifica
1	100	30	33.35	0.130	SI

L'ampiezza delle fessure è sempre al di sotto dei limiti previsti da normativa, pertanto, le verifiche si possono ritenere soddisfatte.

# TOMBINO $\Phi$ 1500 (ric.=0.6 m)

## 15 ANALISI DEI CARICHI

I calcoli sono stati effettuati considerando la struttura sottoposta alle azioni indotte da:

- Peso proprio
- Carichi permanenti interni
- Carichi permanenti esterni
- Spinte del terreno
- Carichi mobili in soletta
- Spinta del sovraccarico
- Azioni dovute a variazione termica uniforme
- Azioni dovute a differenza di temperatura tra estradosso ed intradosso
- Azione dovuta al ritiro differenziale
- Azioni sismiche

Si precisa che le sollecitazioni sono calcolate con riferimento ad un concio di 1 metro di manufatto e che a tale porzione di struttura sono quindi riportate tutte le azioni di calcolo (analisi a telaio piano).

### 15.1 CARICHI PERMANENTI

#### 15.1.1 *Peso Proprio Elementi Strutturali*

Il peso proprio degli elementi strutturali è determinato automaticamente dal programma di calcolo, in base al peso dell'unità di volume del calcestruzzo  $\gamma_{cls} = 25 \text{ KN/m}^3$ .

#### 15.1.2 *Carichi agenti sulla soletta superiore*

Il carico permanente in copertura è dovuto alla presenza del rilevato ed è pari a:

$$Q_R = P_{p, ril} * R = 20 * 0.6 = 12 \text{ kN/m}^2 \quad \text{con } R = \text{altezza media del rilevato}$$

Peso proprio del rilevato

### 15.1.3 Carichi agenti in fondazione

In fondazione non si considera la presenza dei permanenti portati perché riducono lo stato sollecitativo della fondazione

### 15.1.4 Spinte Laterali

Per la valutazione delle Spinte del terreno si è fatto riferimento alla teoria di Coulomb. La teoria di Coulomb considera l'ipotesi di un cuneo di spinta a monte della parete che si muove rigidamente lungo una superficie di rottura rettilinea. Dall'equilibrio del cuneo si ricava la spinta che il terreno esercita sull'opera di sostegno. In particolare, Coulomb ammette, al contrario della teoria di Rankine, l'esistenza di attrito fra il terreno e la parete, e quindi la retta di spinta risulta inclinata rispetto alla normale alla parete stesso di un angolo di attrito terra-parete.

L'espressione della spinta esercitata da un terrapieno, di peso di volume  $\gamma$ , su una parete di altezza  $H$ , risulta espressa secondo la teoria di Coulomb dalla seguente relazione (per terreno incoerente):

$$S = \frac{1}{2} \cdot \gamma \cdot H^2 \cdot K_a$$

$K_a$  rappresenta il coefficiente di spinta attiva di Coulomb nella versione riveduta da Muller-Breslau, espresso come:

$$K_a = \frac{\sin^2(\alpha + \phi)}{\sin^2 \alpha \cdot \sin(\alpha - \delta) \cdot \left[ 1 + \frac{\sqrt{\sin(\phi + \delta) \cdot \sin(\phi - \beta)}}{\sqrt{\sin(\alpha - \delta) \cdot \sin(\alpha + \beta)}} \right]^2}$$

dove  $f$  è l'angolo d'attrito del terreno,  $\alpha$  rappresenta l'angolo che la parete forma con l'orizzontale ( $\alpha = 90^\circ$  per parete verticale),  $\delta$  è l'angolo d'attrito terreno-parete,  $\beta$  è l'inclinazione del terrapieno rispetto all'orizzontale.

La spinta risulta inclinata dell'angolo d'attrito terreno-parete rispetto alla normale alla parete.

Il diagramma delle pressioni del terreno sulla parete risulta triangolare con il vertice in alto.

Il punto di applicazione della spinta si trova in corrispondenza del baricentro del diagramma delle pressioni ( $1/3 H$  rispetto alla base della parete). L'espressione di  $K_a$  perde di significato per  $\beta > \phi$ .

Questo coincide con quanto si intuisce fisicamente: la pendenza del terreno a monte della parete non può superare l'angolo di natural declivio del terreno stesso.

Nel caso di terreno dotato di attrito e coesione  $c'$  l'espressione della pressione del terreno ad una generica profondità  $z$  vale:

$$\sigma_a = \gamma \cdot z \cdot K_a - 2 \cdot c' \cdot \sqrt{K_a}$$

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

Nel caso in esame, tuttavia, in considerazione della ridotta capacità de formativa dell’opera, si è assunto che sui piedritti agisca la spinta calcolata in condizioni di riposo. Tale assunzione deriva dalla considerazione che nel terreno circostante la struttura in esame, che si prevede costipato a rullo con le usuali modalità, non possa mobilitarsi la spinta attiva in quanto la notevole rigidezza della struttura non consente la produzione degli spostamenti necessari alla sua attivazione.

Il coefficiente di spinta a riposo  $K_0$  è espresso dalla relazione:

$$K_0 = 1 - \sin \phi = 0.426$$

Dove  $\phi$  rappresenta l'angolo d'attrito interno del terreno di rinfianco.

Quindi la pressione laterale, ad una generica profondità  $z$  e la spinta totale sulla parete di altezza  $H$  valgono:

$$\sigma = \gamma \cdot z \cdot K_0 + p_v \cdot K_0$$

$$S = \frac{1}{2} \cdot \gamma \cdot H^2 \cdot K_0 + p_v \cdot K_0 \cdot H$$

dove  $p_v$  è la pressione verticale agente in corrispondenza della calotta.

Considerando che il terreno di riempimento ed il suo relativo grado di compattazione determineranno il regime delle spinte verticali ed orizzontali sui ritti del tombino, valutando inoltre la possibilità che il materiale di scavo venga parzialmente recuperato, almeno per le frazioni di migliore qualità, per tale riempimento, si adottano i seguenti parametri geotecnici medi del terreno in sito:

- angolo di attrito interno  $\phi' = 35^\circ$
- coesione  $c' = 0 \text{ kPa}$
- peso di volume del terreno  $\gamma = 20 \text{ kN/m}^3$

La spinta a riposo del terreno sui piedritti è calcolata in automatico dal programma di calcolo.

La pressione del terreno agente alle profondità degli assi baricentrici delle solette vale:

$$p_{t1} = K_0 \times \gamma t \times (R + ST / 2) \quad [\text{kN/m}^2]$$

$$p_{t2} = K_0 \times \gamma t \times (R + ST + B + SF / 2) \quad [\text{kN/m}^2]$$

Tali forze vengono computate automaticamente nel modello.

**Spinta laterale del terreno**

### 15.1.5 Spinta in presenza di falda

Nel caso in cui a monte della parete sia presente la falda il diagramma delle pressioni sulla parete risulta modificato a causa della sottospinta che l'acqua esercita sul terreno. Il peso di volume del terreno al di sopra della linea di falda non subisce variazioni. Viceversa, al di sotto del livello di falda va considerato il peso di volume di galleggiamento:

$$\gamma_a = \gamma_{sat} - \gamma_w$$

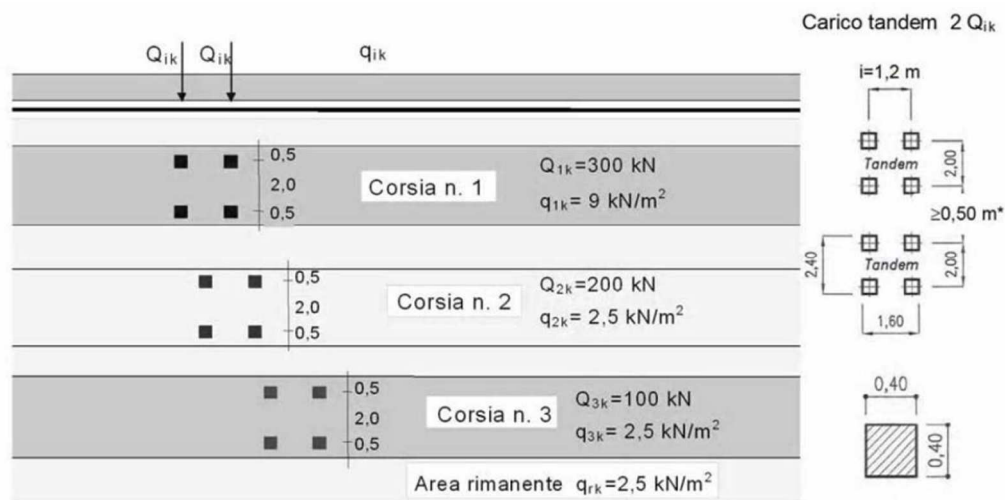

dove  $\gamma_{sat}$  è il peso di volume saturo del terreno (dipendente dall'indice dei pori) e  $\gamma_w$  è il peso di volume dell'acqua.

Quindi il diagramma delle pressioni al di sotto della linea di falda ha una pendenza minore. Al diagramma così ottenuto va sommato il diagramma triangolare legato alla pressione idrostatica esercitata dall'acqua.

## 15.2 CARICHI MOBILI IN COPERTURA

### 15.2.1 Carichi mobili esterni

Per la determinazione dei carichi accidentali da traffico da considerare sul piano della pavimentazione, si è fatto riferimento agli schemi di carico stabilità al punto 5.1.3.3.3 del DM 17/01/18 di cui nel seguito:

**Schema di carico 1**

Lo schema di carico, da Normativa, è in particolare costituito dalle seguenti colonne di carico:

- una colonna di carichi (ingombro = 3 m) costituita da un automezzo convenzionale  $Q_{1k}$  di 600 kN dotato di 2 assi di 2 ruote ciascuno, distanti 1.20 m in senso longitudinale e con interasse ruote in senso trasversale di 2.00 m; un carico ripartito  $q_{1k}$  di 9 kN/m<sup>2</sup> uniformemente distribuito;
- una seconda colonna di carichi (ingombro = 3 m), analoga alla precedente, ma con carichi pari rispettivamente a 400 kN di  $Q_{1k}$  e 2.5 kN/m<sup>2</sup> di  $q_{1k}$  e posta ad interasse di 3.00 m. da essa;

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

- una terza colonna di carichi (ingombro = 3 m), analoga alla precedente, ma con carichi pari rispettivamente a 200 kN di Q<sub>1k</sub> e 2.5 kN/m<sup>2</sup> di q<sub>1k</sub> e posta ad interasse di 3.00 m. da essa;
- un carico uniforme q<sub>rk</sub> = 2.5 kN/m<sup>2</sup> nella zona di carreggiata non impegnata dai carichi precedenti.

Si è assunto inoltre di diffondere il carico fino al piano medio della soletta, secondo quanto riportato negli schemi grafici di figura seguente:

**Schema di diffusione in soletta carichi Q1**

Ai fini delle analisi, si è assunto di trasformare i carichi concentrati Q<sub>1k</sub> in un carico distribuito equivalente agente sul piano medio della soletta.

Il carico di progetto utile alla simulazione del carico Q<sub>1(assi)</sub> è stato valutato come di seguito:

$$Q_{1\text{ prog}} = 600 / (L_{d\text{ tr}} \times L_{d\text{ long}})$$

Se L<sub>dtr</sub> risulta maggiore di 3.00 m, a Q<sub>1prog</sub> dovuto alla prima colonna di carico va aggiunto una seconda colonna di carico per tener conto della zona di sovrapposizione dei carichi, il carico della seconda colonna è pari a:

$$Q_{2\text{ prog}} = 400 / (L_{d\text{ tr}} \times L_{d\text{ long}})$$

tenendo comunque presente l'effetto della collaborazione strutturale in direzione longitudinale all'opera stessa.

Essendoci in soletta un ricoprimento minimo pari a 0.60 m costituito da terreno da rilevato e quindi di buone caratteristiche, si ha:

Ingombro trasversale:  $L_{d\text{ tr}} = 1.60 + 2 \cdot (0.60 \cdot \tan 35^\circ + 0.16/2 \cdot \tan 45^\circ) = 2.60 \text{ m}$

Ingombro longitudinale:  $L_{d\text{ long}} = 2.40 + 2 \cdot (0.60 \cdot \tan 35^\circ + 0.16/2 \cdot \tan 45^\circ) = 3.40 \text{ m}$

Essendo L<sub>d tr</sub> inferiore a 3.00 m, non si considera la presenza della seconda colonna di carico.

I carichi concentrati  $Q_{1k}$  sono stati trasformati in un carico distribuito equivalente agente sul piano medio della soletta che, con riferimento alla colonna di carico 1, risulta:

$$Q_{1kd} = 600 / (L_{d\ tr} \times L_{d\ long}) = 600 / (3.40 \times 2.60) = 67.87 \text{ kN/m}^2$$

In aggiunta, si deve considerare un ulteriore carico agente sul piano stradale pari a  $9 \text{ kN/m}^2$ , trascurando cautelativamente gli effetti di diffusione.

La somma del sovraccarico dovuto agli assi e al carico uniforme è pari a:

$$q_{tot} = Q_{1kd} + q_{1k,dis} = 67.87 + 9.00 = 76.87 \text{ kN/m}^2$$

Tale valore risulta uniformemente distribuito lungo l'intera sezione trasversale del tombino.

### 15.2.2 Frenatura

L'azione di frenamento, con riferimento al par. 5.1.3.5 delle NTC del 2018, è assunta pari a:

$$180 \text{ kN} \leq q_3 = 0,6 (2Q_{1k}) + 0,10q_{1k} \cdot w_1 \cdot L \leq 900 \text{ kN}$$

Di conseguenza:

$$q_3 = 364.914 \text{ kN}$$

Con:

$$Q_{1k} = 300 \text{ kN} \quad \text{Carichi tandem concentrati}$$

$$q_{1k} = 9 \text{ kN/m}^2 \quad \text{Carico distribuito}$$

$$w_1 = 3.00 \text{ m} \quad \text{Larghezza corsia}$$

$$L_{fr.} = 1.82 \text{ m} \quad \text{Larghezza dello scatolare}$$

Tale azione è funzione del carico verticale totale agente sulla corsia convenzionale n.1 e a vantaggio di sicurezza è sempre assunta agente sulla larghezza della sede stradale che ricade sul sottovia o tombino:

$$F_{fr. eq.} = 364.914 / (13.86 \times 1.82) \cong 14.47 \text{ kN/m}^2$$

### 15.2.3 Spinta del sovraccarico accidentale

La spinta del carico accidentale si considera agente solo sul ritto di sinistra ed ha un valore costante con la profondità pari a:

$$s_{accSX} = k_0 \times q = 0.426 \times 20 = 8.52 \text{ kN/m}^2$$

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

**15.2.4 Azione dovuta al ritiro differenziale in soletta**

Gli effetti del ritiro del calcestruzzo e della viscosità sono trascurabili a causa dell'esigüe dimensioni dell'opera.

**15.2.5 Azione dovuta a variazione termica uniforme**

Si è tenuto conto di eventuali effetti termici dovuti a variazioni di temperatura sull'opera, applicando una variazione termica uniforme di 15°;

**15.2.6 Azioni dovute a variazione termica tra estradosso ed intradosso**

Si è tenuto conto di eventuali effetti termici dovuti a variazioni di temperatura sull'opera, applicando una variazione termica in soletta tra estradosso ed intradosso pari a ±2.5°.

**15.3 AZIONI SISMICHE**

Queste azioni vengono calcolate in automatico dal codice di calcolo SCAT11.

Per il calcolo dell'azione sismica si è utilizzato il metodo dell'analisi pseudostatica in cui l'azione sismica è rappresentata da una forza statica equivalente pari al prodotto delle forze di gravità per un opportuno coefficiente sismico k.

**15.3.1 Forze d'inerzia**

Le forze sismiche sono pertanto le seguenti:

Forza sismica orizzontale  $F_h = k_h * W$

Forza sismica verticale  $F_v = k_v * W$

I valori dei coefficienti sismici orizzontale  $k_h$  e verticale  $k_v$  possono essere valutati mediante le espressioni:

$$k_h = \frac{a_{max}}{g} S_s S_t \beta_m$$

$$k_v = \pm 0,5 k_h$$

Nel caso specifico, in accordo a quanto già riportato al precedente paragrafo risulta:

- $T_{R,SLV}$  = 946anni;
- $a_{g,SLV}$  = **0.283 g**;

Potendo considerare generalmente sottosuoli di **tipo C** per l'intero lotto in progetto, risulta nel caso in esame:

Cat Suolo	<b>C</b>
$S_S$ =	<b>1.283</b>
$S_T$ =	<b>1.00</b>

$K_h$ [--] =	<b>0,363</b>	Coefficiente sismico orizzontale
$K_v$ [--] =	<b>0,182</b>	Coefficiente sismico verticale

### 15.3.2 Spinta sismica terreno

Le spinte del terreno in fase sismica sono state determinate con la teoria di Wood, secondo la quale la risultante dell'incremento di spinta per effetto del sisma su una parete di altezza H viene determinata con la seguente espressione:

$$\Delta S_E = K_h \gamma H^2$$

## 16 COMBINAZIONI DI CARICO

Le condizioni di carico considerate per lo scatolare sono le seguenti:

- Peso proprio
- Spinta terreno sinistra
- Spinta terreno destra
- Sisma da sinistra
- Sisma da destra

**S\_VAR\_SX** Spinta delle terre sulla parete di destra

**VAR** Sovraccarichi variabili sulla soletta superiore

**TERM. (+)/(-)** Azione termica

**FRE** Frenamento

### Riepilogo condizioni di carico per lo scatolare

Si riportano di seguito le combinazioni di carico ritenute più significative con i coefficienti di combinazione  $\gamma \cdot \psi$ . Essendo la struttura simmetrica, si adottano tipologie di combinazione asimmetriche in modo da massimizzare le sollecitazioni. Il dimensionamento delle armature e le verifiche strutturali verranno poi eseguite tenendo conto della simmetria e verificando le condizioni peggiori per ogni lato della struttura.

#### Combinazione n° 1 SLU (Caso A1-M1)

## 17 RISULTATI, ANALISI E VERIFICHE

### 17.1 MODELLO DI CALCOLO

Di seguito di riporta una descrizione della modellazione effettuata mediante ausilio del software di calcolo SCAT v.11 prodotto dalla AZTEC Informativa, con una descrizione del modello strutturale implementato.

Di seguito di riporta una descrizione del modello geometrico/geotecnico considerato ai fini del dimensionamento.

Modello Geometrico Geotecnico di Riferimento – 1/2

Modello Geometrico Geotecnico di Riferimento – 2/2

A partire dal tipo di terreno, dalla geometria e dai sovraccarichi agenti il programma è in grado di conoscere tutti i carichi agenti sulla struttura per ogni combinazione di carico.

La struttura scatolare viene schematizzata come un telaio piano e viene risolta mediante il metodo degli elementi finiti (FEM). Più dettagliatamente il telaio viene discretizzato in una serie di elementi connessi fra di loro nei nodi.

## **TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

Il terreno di fondazione viene schematizzato con una serie di elementi molle non reagenti a trazione (modello di Winkler). L'area della singola molla è direttamente proporzionale alla costante di Winkler del terreno e all'area di influenza della molla stessa.

A partire dalla matrice di rigidezza del singolo elemento,  $K_e$ , si assembla la matrice di rigidezza di tutta la struttura  $K$ . Tutti i carichi agenti sulla struttura vengono trasformati in carichi nodali (reazioni di incastro perfetto) ed inseriti nel vettore dei carichi nodali  $p$ .

Indicando con  $u$  il vettore degli spostamenti nodali (incogniti), la relazione risolutiva può essere scritta nella forma

$$K \cdot u = p$$

Da questa equazione matriciale si ricavano gli spostamenti incogniti  $u$

$$u = K^{(-1)} p$$

Noti gli spostamenti nodali è possibile risalire alle sollecitazioni nei vari elementi.

La soluzione del sistema viene fatta per ogni combinazione di carico agente sullo scatolare. Il successivo calcolo delle armature nei vari elementi viene condotto tenendo conto delle condizioni più gravose che si possono verificare nelle sezioni fra tutte le combinazioni di carico.

## 17.2 SOLLECITAZIONI DI CALCOLO

Si riportano, di seguito, i diagrammi di inviluppo delle caratteristiche delle sollecitazioni di Flessione, Taglio e Sforzo Normale della combinazione più gravosa (INV\_SLU-SISMA); le unità di misura dei grafici sono i KN e m.

24.108 kNm

**Inviluppo diagrammi del momento flettente – SLU statico e sismico**

42.604 kN

**Inviluppo diagrammi del taglio – SLU statico e sismico**

106.294 kN

**Inviluppo diagrammi dello sforzo normale – SLU statico e sismico**

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

24.108 kNm

**Inviluppo diagrammi del momento flettente – SLE**

42.604 kN

**Inviluppo diagrammi del taglio – SLE**

106.294 kN

**Inviluppo diagrammi dello sforzo normale – SLE**

Si precisa nuovamente che, la non simmetria del diagramma è legata all'aver considerato combinazioni di carico emisimmetriche.

#### 17.4 ARMATURE DI PROGETTO

Nella tabella seguente si riportano le armature di progetto previste per la sezione di calcolo in questione, come desumibili dagli elaborati grafici di armatura delle opere relative:

<i>Elemento</i>	<b>Armatura a flessione</b>		<b>Armatura a taglio</b>
	<b>Af 1</b>	<b>Af 2</b>	<b>Af t</b>
-	1 $\phi$ 12/20	1 $\phi$ 12/20	

**Af1** : Armatura lato esterno (terreno)

**Af2** : Armatura lato interno

**Aft**: Armatura a taglio

Ai fini delle verifiche si è fatto riferimento ad un copriferro di calcolo (asse armature) pari a 3.6 cm e un copriferro filo esterno armature pari a 3 cm.

Si evidenzia inoltre che le sollecitazioni di progetto non hanno richiesto una specifica armatura a taglio, essendo già soddisfatte le verifiche condotte con previsti dal DM 17.01.18 per le strutture non armate a taglio; è stata comunque prevista un'armatura di collegamento trasversale 1 $\phi$ 6/40x40.

## 17.6 RISULTATI VERIFICHE (STR)

Il software esegue in automatico tutte le verifiche strutturali sia allo stato limite ultimo che allo stato limite di esercizio. Per quanto riguarda il taglio il programma prevede sia la verifica per elementi non armati a taglio e sia quella per elementi dotati di apposita armatura a taglio, disponendo, tuttavia, ferri sagomati resistenti a taglio e non staffe o tiranti. Per questo motivo le verifiche a taglio vengono eseguite manualmente attraverso l'ausilio di fogli di calcolo strutturati ad hoc.

I criteri generali di verifica adottati dal Software sono quelli esposti al Capitolo 7.

Le verifiche esposte fanno riferimento alla sezione maggiormente sollecitata lungo l'intero tombino circolare.

In virtù della particolare forma della sezione, il software suddivide la stessa in due elementi, ovvero l'elemento trasverso (semicirconferenza superiore) e l'elemento fondazione (semicirconferenza inferiore), per ciascuna dei quali sono state considerate 5 sezioni di verifica.

### 17.6.1 Verifiche allo SLU

Nel seguente paragrafo si riportano le verifiche a flessione e a taglio.

#### 17.6.1.1 Verifica a flessione

Si mostrano, nelle seguenti tabelle, le verifiche SLU nei confronti della flessione. Si riportano per semplicità le verifiche più gravose per la struttura.

*Simbologia adottata ed unità di misura*

*X* Ascissa/Ordinata sezione, espresso in cm

*A<sub>fi</sub>* Area armatura inferiore, espresse in cm<sup>2</sup>

*A<sub>fs</sub>* Area armatura superiore, espresse in cm<sup>2</sup>

*CS* Coeff. di sicurezza sezione

### Inviluppo verifiche stato limite ultimo (SLU)

#### Verifica sezioni fondazione (Inviluppo)

Base sezione B = 100 cm

Altezza sezione H = 16.00 cm

X	A <sub>fi</sub>	A <sub>fs</sub>	CS
0.08	5.65	5.65	2.40
0.48	5.65	5.65	12.01
0.91	5.65	5.65	3.27
1.34	5.65	5.65	3.45
1.74	5.65	5.65	2.22

#### Verifica sezioni trasverso (Inviluppo)

Base sezione B = 100 cm

Altezza sezione H = 16.00 cm

X	A <sub>fi</sub>	A <sub>fs</sub>	CS
0.08	5.65	5.65	2.38
0.48	5.65	5.65	1.56
0.91	5.65	5.65	1.39
1.34	5.65	5.65	2.02
1.74	5.65	5.65	2.02

### 17.6.1.2 Verifica a taglio

I risultati ottenuti dalle verifiche delle sezioni maggiormente sollecitate per la struttura in esame sono riepilogati nella seguente tabella.

Sezione	b	h	V <sub>Ed</sub>	V <sub>RSd</sub> *	V <sub>R cd</sub>	Verificato
[-]	[cm]	[cm]	[kN]	[kN]	[kN]	[-]
-	100	16	28.27	-	45.47	SI

### 17.6.2 Verifiche allo SLE

Nel seguente paragrafo si riportano le verifiche allo stato limite di apertura delle fessure e le verifiche delle tensioni per il calcestruzzo e per l'acciaio di armatura.

#### 17.6.2.1 Verifica a fessurazione

Nella seguente figura vengono riportati lo schema con indicazione delle zone della struttura ove si innesca il processo di fessurazione:

Schema con indicazione delle zone fessurate

A seguire i relativi valori di ampiezza delle fessure ricavati per la combinazione frequente e quasi permanente.

### Verifiche fessurazione

Simbologia adottata ed unità di misura

N° Indice sezione

X<sub>i</sub> Ascissa/Ordinata sezione, espresso in m

L'ampiezza delle fessure è sempre al di sotto dei limiti sopra descritti, pertanto, le verifiche si possono ritenere soddisfatte.

**17.6.2.2 Verifica delle tensioni**

Nella seguente tabella sono riportati i risultati delle verifiche allo SLE dei limiti tensionali di lavoro nel calcestruzzo e nelle barre di armatura.

Tali tensioni risultano sempre al di sotto dei limiti indicati dalla normativa, pertanto, le verifiche si possono ritenere soddisfatte. Vengono riportate le verifiche più gravose.

**Verifiche combinazioni SLE**

Simbologia adottata ed unità di misura

N° Indice sezione

X Ascissa/Ordinata sezione, espresso in m

M Momento flettente, espresso in kNm

V Taglio, espresso in kN

N Sforzo normale, espresso in kN

A<sub>f</sub> Area armatura inferiore, espressa in cmq

A<sub>s</sub> Area armatura superiore, espressa in cmq

σ<sub>f</sub> Tensione nell'armatura disposta in corrispondenza del lembo inferiore, espressa in MPa

σ<sub>s</sub> Tensione nell'armatura disposta in corrispondenza del lembo superiore, espressa in MPa

σ<sub>c</sub> Tensione nel calcestruzzo, espressa in MPa

τ<sub>c</sub> Tensione tangenziale nel calcestruzzo, espressa in MPa

A<sub>sv</sub> Area armature trasversali nella sezione, espressa in cmq

**Verifica sezioni fondazione [Combinazione n° 19 - SLE (Quasi Permanente)]**

Base sezione B = 100 cm

Altezza sezione H = 16.00 cm

## 17.7 RISULTATI VERIFICHE (GEO)

Il software esegue in automatico tutte le verifiche geotecniche sia allo stato limite ultimo che allo stato limite di esercizio. I criteri generali di verifica adottati dal Software sono quelli esposti al Capitolo 8.

### 17.7.1 Verifica a Stato limite di esercizio

Nei paragrafi seguenti sono riportati i tabulati con le pressioni di contatto fondazione-terreno e i cedimenti attesi.

#### 17.7.1.1 Pressioni di contatto fondazione-terreno

Le pressioni di contatto terreno-fondazione sono ricavate con riferimento all'involuppo dello Stato limite di esercizio.

#### Involuppo pressioni sul terreno di fondazione

### 17.7.2 Verifica a stato limite ultimo

Nel paragrafo seguente sono riportati i tabulati con la verifica a carico limite.

#### 17.7.2.1 Verifica a carico limite

La verifica a carico limite è stata eseguita in automatico dal software di calcolo attraverso l'utilizzo della formula di Meyerhof, come già specificato in precedenza; nel seguito si riportano i risultati ottenuti per il caso in esame:

### Verifiche geotecniche

#### Simbologia adottata

IC Indice della combinazione

$N_c, N_q, N_\gamma$  Fattori di capacità portante

$N_c, N_q, N_\gamma$  Fattori di capacità portante corretti per effetto forma, inclinazione del carico, affondamento, etc.

$q_u$  Portanza ultima del terreno, espressa in [MPa]

$Q_v$  Portanza ultima del terreno, espressa in [kN]/m

$Q_y$  Carico verticale al piano di posa, espressa in [kN]/m

FS Fattore di sicurezza a carico limite

# TOMBINO $\Phi$ 1500 (ric.=3.5 m)

## 18 ANALISI DEI CARICHI

I calcoli sono stati effettuati considerando la struttura sottoposta alle azioni indotte da:

- Peso proprio
- Carichi permanenti interni
- Carichi permanenti esterni
- Spinte del terreno
- Carichi mobili in soletta
- Spinta del sovraccarico
- Azioni dovute a variazione termica uniforme
- Azioni dovute a differenza di temperatura tra estradosso ed intradosso
- Azione dovuta al ritiro differenziale
- Azioni sismiche

Si precisa che le sollecitazioni sono calcolate con riferimento ad un concio di 1 metro di manufatto e che a tale porzione di struttura sono quindi riportate tutte le azioni di calcolo (analisi a telaio piano).

### 18.1 CARICHI PERMANENTI

#### 18.1.1 *Peso Proprio Elementi Strutturali*

Il peso proprio degli elementi strutturali è determinato automaticamente dal programma di calcolo, in base al peso dell'unità di volume del calcestruzzo  $\gamma_{cls} = 25 \text{ KN/m}^3$ .

#### 18.1.2 *Carichi agenti sulla soletta superiore*

Il carico permanente in copertura è dovuto alla presenza del rilevato ed è pari a:

$$Q_R = P_{p, ril} * R = 20 * 3.50 = 70 \text{ kN/m}^2 \quad \text{con } R = \text{altezza media del rilevato}$$

Peso proprio del rilevato

### 18.1.3 Carichi agenti in fondazione

In fondazione non si considera la presenza dei permanenti portati perché riducono lo stato sollecitativo della fondazione

### 18.1.4 Spinte Laterali

Per lavalutazione delle Spinte del terreno si è fatto riferimento alla teoria di Coluomb. La teoria di Coulomb considera l'ipotesi di un cuneo di spinta a monte della parete che si muove rigidamente lungo una superficie di rottura rettilinea. Dall'equilibrio del cuneo si ricava la spinta che il terreno esercita sull'opera di sostegno. In particolare, Coulomb ammette, al contrario della teoria di Rankine, l'esistenza di attrito fra il terreno e la parete, e quindi la retta di spinta risulta inclinata rispetto alla normale alla parete stesso di un angolo di attrito terra-parete.

L'espressione della spinta esercitata da un terrapieno, di peso di volume  $\gamma$ , su una parete di altezza H, risulta espressa secondo la teoria di Coulomb dalla seguente relazione (per terreno incoerente):

$$S = \frac{1}{2} \cdot \gamma \cdot H^2 \cdot K_a$$

$K_a$  rappresenta il coefficiente di spinta attiva di Coulomb nella versione riveduta da Muller-Breslau, espresso come:

$$K_a = \frac{\sin^2(\alpha + \phi)}{\sin^2 \alpha \cdot \sin(\alpha - \delta) \cdot \left[ 1 + \frac{\sqrt{\sin(\phi + \delta) \cdot \sin(\phi - \beta)}}{\sqrt{\sin(\alpha - \delta) \cdot \sin(\alpha + \beta)}} \right]^2}$$

dove  $f$  è l'angolo d'attrito del terreno,  $\alpha$  rappresenta l'angolo che la parete forma con l'orizzontale ( $\alpha = 90^\circ$  per parete verticale),  $\delta$  è l'angolo d'attrito terreno-parete,  $\beta$  è l'inclinazione del terrapieno rispetto all'orizzontale.

La spinta risulta inclinata dell'angolo d'attrito terreno-parete rispetto alla normale alla parete.

Il diagramma delle pressioni del terreno sulla parete risulta triangolare con il vertice in alto.

Il punto di applicazione della spinta si trova in corrispondenza del baricentro del diagramma delle pressioni ( $1/3 H$  rispetto alla base della parete). L'espressione di  $K_a$  perde di significato per  $\beta > \phi$ .

Questo coincide con quanto si intuisce fisicamente: la pendenza del terreno a monte della parete non può superare l'angolo di natural declivio del terreno stesso.

Nel caso di terreno dotato di attrito e coesione  $c'$  l'espressione della pressione del terreno ad una generica profondità  $z$  vale:

$$\sigma_a = \gamma \cdot z \cdot K_a - 2 \cdot c' \cdot \sqrt{K_a}$$

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

Nel caso in esame, tuttavia, in considerazione della ridotta capacità de formativa dell’opera, si è assunto che sui piedritti agisca la spinta calcolata in condizioni di riposo. Tale assunzione deriva dalla considerazione che nel terreno circostante la struttura in esame, che si prevede costipato a rullo con le usuali modalità, non possa mobilitarsi la spinta attiva in quanto la notevole rigidezza della struttura non consente la produzione degli spostamenti necessari alla sua attivazione.

Il coefficiente di spinta a riposo  $k_0$  è espresso dalla relazione:

$$K_0 = 1 - \sin \varphi = 0.426$$

Dove  $\phi$  rappresenta l'angolo d'attrito interno del terreno di rinfiacco.

Quindi la pressione laterale, ad una generica profondità  $z$  e la spinta totale sulla parete di altezza  $H$  valgono:

$$\sigma = \gamma \cdot z \cdot K_0 + p_v \cdot K_0$$

$$S = \frac{1}{2} \cdot \gamma \cdot H^2 \cdot K_0 + p_v \cdot K_0 \cdot H$$

dove  $p_v$  è la pressione verticale agente in corrispondenza della calotta.

Considerando che il terreno di riempimento ed il suo relativo grado di compattazione determineranno il regime delle spinte verticali ed orizzontali sui ritti del tombino, valutando inoltre la possibilità che il materiale di scavo venga parzialmente recuperato, almeno per le frazioni di migliore qualità, per tale riempimento, si adottano i seguenti parametri geotecnici medi del terreno in sito:

- angolo di attrito interno  $\phi' = 35^\circ$
- coesione  $c' = 0 \text{ kPa}$
- peso di volume del terreno  $\gamma = 20 \text{ kN/m}^3$

La spinta a riposo del terreno sui piedritti è calcolata in automatico dal programma di calcolo.

La pressione del terreno agente alle profondità degli assi baricentrici delle solette vale:

$$p_{t1} = K_0 \times \gamma t \times (R + ST / 2) \quad [\text{kN/m}^2]$$

$$p_{t2} = K_0 \times \gamma t \times (R + ST + B + SF / 2) \quad [\text{kN/m}^2]$$

Tali forze vengono computate automaticamente nel modello.

Spinta laterale del terreno

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

**18.1.5 Spinta in presenza di falda**

Nel caso in cui a monte della parete sia presente la falda il diagramma delle pressioni sulla parete risulta modificato a causa della sottospinta che l'acqua esercita sul terreno. Il peso di volume del terreno al di sopra della linea di falda non subisce variazioni. Viceversa, al di sotto del livello di falda va considerato il peso di volume di galleggiamento:

$$\gamma_a = \gamma_{sat} - \gamma_w$$

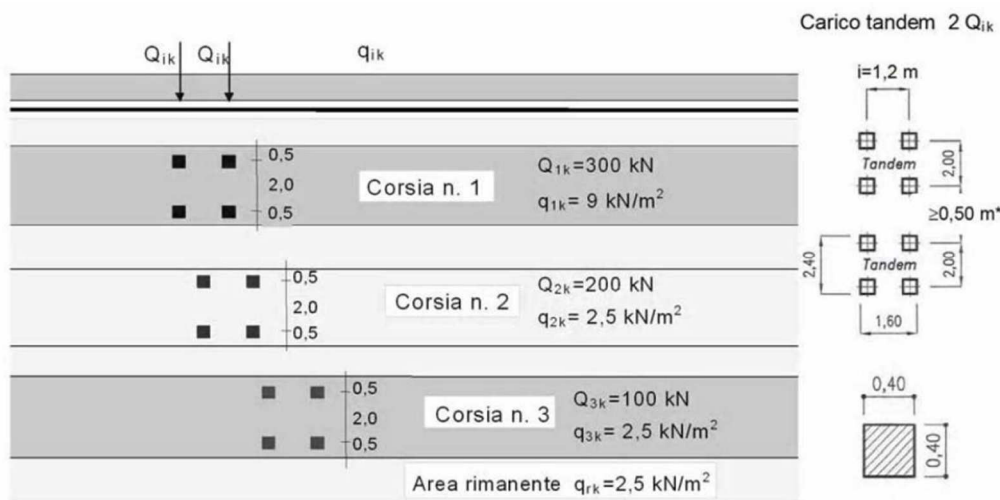

dove  $\gamma_{sat}$  è il peso di volume saturo del terreno (dipendente dall'indice dei pori) e  $\gamma_w$  è il peso di volume dell'acqua.

Quindi il diagramma delle pressioni al di sotto della linea di falda ha una pendenza minore. Al diagramma così ottenuto va sommato il diagramma triangolare legato alla pressione idrostatica esercitata dall'acqua.

**18.2 CARICHI MOBILI IN COPERTURA**

**18.2.1 Carichi mobili esterni**

Per la determinazione dei carichi accidentali da traffico da considerare sul piano della pavimentazione, si è fatto riferimento agli schemi di carico stabilità al punto 5.1.3.3.3 del DM 17/01/18 di cui nel seguito:

**Schema di carico 1**

Lo schema di carico, da Normativa, è in particolare costituito dalle seguenti colonne di carico:

- una colonna di carichi (ingombro = 3 m) costituita da un automezzo convenzionale  $Q_{1k}$  di 600 kN dotato di 2 assi di 2 ruote ciascuno, distanti 1.20 m in senso longitudinale e con interasse ruote in senso trasversale di 2.00 m; un carico ripartito  $q_{1k}$  di  $9 \text{ kN/m}^2$  uniformemente distribuito;
- una seconda colonna di carichi (ingombro = 3 m), analoga alla precedente, ma con carichi pari rispettivamente a 400 kN di  $Q_{1k}$  e  $2.5 \text{ kN/m}^2$  di  $q_{1k}$  e posta ad interasse di 3.00 m. da essa;

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

- una terza colonna di carichi (ingombro = 3 m), analoga alla precedente, ma con carichi pari rispettivamente a 200 kN di Q<sub>1k</sub> e 2.5 kN/m<sup>2</sup> di q<sub>1k</sub> e posta ad interasse di 3.00 m. da essa;
- un carico uniforme q<sub>rk</sub> = 2.5 kN/m<sup>2</sup> nella zona di carreggiata non impegnata dai carichi precedenti.

Si è assunto inoltre di diffondere il carico fino al piano medio della soletta, secondo quanto riportato negli schemi grafici di figura seguente:

**Schema di diffusione in soletta carichi Q1**

Ai fini delle analisi, si è assunto di trasformare i carichi concentrati Q<sub>1k</sub> in un carico distribuito equivalente agente sul piano medio della soletta.

Il carico di progetto utile alla simulazione del carico Q<sub>1(assi)</sub> è stato valutato come di seguito:

$$Q_{1\text{prog}} = 600 / (L_{d\text{tr}} \times L_{d\text{long}})$$

Se L<sub>dtr</sub> risulta maggiore di 3.00 m, a Q<sub>1prog</sub> dovuto alla prima colonna di carico va aggiunto una seconda colonna di carico per tener conto della zona di sovrapposizione dei carichi, il carico della seconda colonna è pari a:

$$Q_{2\text{prog}} = 400 / (L_{d\text{tr}} \times L_{d\text{long}})$$

tenendo comunque presente l'effetto della collaborazione strutturale in direzione longitudinale all'opera stessa.

Essendoci in soletta un ricoprimento minimo pari a 0.60 m costituito da terreno da rilevato e quindi di buone caratteristiche, si ha:

Ingombro trasversale:  $L_{d\text{tr}} = 0.40 + 1.20 + 2 \cdot (3.50 \cdot \tan 35^\circ + 0.16/2 \cdot \tan 45^\circ) = 6.66 \text{ m}$

Ingombro longitudinale:  $L_{d\text{long}} = 2.40 + 2.40 + 2 \cdot (3.50 \cdot \tan 35^\circ + 0.16/2 \cdot \tan 45^\circ) = 7.46$

Essendo L<sub>dtr</sub> superiore a 3.00 m, si considera la presenza della seconda colonna di carico.

I carichi concentrati  $Q_{1k}$  sono stati trasformati in un carico distribuito equivalente agente sul piano medio della soletta che, con riferimento alla colonna di carico 1, risulta:

$$Q_{1kd} = 600 / (L_{d\ tr} \times L_{d\ long}) = (600+400)/(6.66 \times 7.46) = 20.13 \text{ kN/m}^2$$

In aggiunta, si deve considerare un ulteriore carico agente sul piano stradale pari a  $9 \text{ kN/m}^2$ , trascurando cautelativamente gli effetti di diffusione.

La somma del sovraccarico dovuto agli assi e al carico uniforme è pari a:

$$q_{tot} = Q_{1kd} + q_{1k,dis} = 20.13 + 9.00 = 29.13 \text{ kN/m}^2$$

Tale valore risulta uniformemente distribuito lungo l'intera sezione trasversale del tombino.

### 18.2.2 Frenatura

L'azione di frenamento, con riferimento al par. 5.1.3.5 delle NTC del 2018, è assunta pari a:

$$180 \text{ kN} \leq q_3 = 0,6 (2Q_{1k}) + 0,10q_{1k} \cdot w_1 \cdot L \leq 900 \text{ kN}$$

Di conseguenza:

$$q_3 = 364.914 \text{ kN}$$

Con:

$$Q_{1k} = 300 \text{ kN} \quad \text{Carichi tandem concentrati}$$

$$q_{1k} = 9 \text{ kN/m}^2 \quad \text{Carico distribuito}$$

$$w_1 = 3.00 \text{ m} \quad \text{Larghezza corsia}$$

$$L_{fr.} = 1.82 \text{ m} \quad \text{Larghezza dello scatolare}$$

Tale azione è funzione del carico verticale totale agente sulla corsia convenzionale n.1 e a vantaggio di sicurezza è sempre assunta agente sulla larghezza della sede stradale che ricade sul sottovia o tombino:

$$F_{fr. eq.} = 364.914 / (13.86 \times 1.82) \cong 14.47 \text{ kN/m}^2$$

### 18.2.3 Spinta del sovraccarico accidentale

La spinta del carico accidentale si considera agente solo sul ritto di sinistra ed ha un valore costante con la profondità pari a:

$$s_{accSX} = k_0 \times q = 0.426 \times 20 = 8.52 \text{ kN/m}^2$$

## TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO

### 18.2.4 Azione dovuta al ritiro differenziale in soletta

Gli effetti del ritiro del calcestruzzo e della viscosità sono trascurabili a causa dell'esigüe dimensioni dell'opera.

### 18.2.5 Azione dovuta a variazione termica uniforme

Si è tenuto conto di eventuali effetti termici dovuti a variazioni di temperatura sull'opera, applicando una variazione termica uniforme di 15°;

### 18.2.6 Azioni dovute a variazione termica tra estradosso ed intradosso

Si è tenuto conto di eventuali effetti termici dovuti a variazioni di temperatura sull'opera, applicando una variazione termica in soletta tra estradosso ed intradosso pari a  $\pm 2.5^\circ$ .

## 18.3 AZIONI SISMICHE

Queste azioni vengono calcolate in automatico dal codice di calcolo SCAT11.

Per il calcolo dell'azione sismica si è utilizzato il metodo dell'analisi pseudostatica in cui l'azione sismica è rappresentata da una forza statica equivalente pari al prodotto delle forze di gravità per un opportuno coefficiente sismico  $k$ .

### 18.3.1 Forze d'inerzia

Le forze sismiche sono pertanto le seguenti:

Forza sismica orizzontale  $F_h = k_h \cdot W$

Forza sismica verticale  $F_v = k_v \cdot W$

I valori dei coefficienti sismici orizzontale  $k_h$  e verticale  $k_v$  possono essere valutati mediante le espressioni:

$$k_h = \frac{a_{max}}{g} S_s S_t \beta_m$$

$$k_v = \pm 0,5 k_h$$

Nel caso specifico, in accordo a quanto già riportato al precedente paragrafo risulta:

- $T_{R,SLV}$  = 946anni;
- $a_{g,SLV}$  = **0.283 g**;

Potendo considerare generalmente sottosuoli di **tipo C** per l'intero lotto in progetto, risulta nel caso in esame:

Cat Suolo	<b>C</b>
$S_S =$	<b>1.283</b>
$S_T =$	<b>1.00</b>

$K_h$ [--] =	<b>0,363</b>	Coefficiente sismico orizzontale
$K_v$ [--] =	<b>0,182</b>	Coefficiente sismico verticale

### 18.3.2 Spinta sismica terreno

Le spinte del terreno in fase sismica sono state determinate con la teoria di Wood, secondo la quale la risultante dell'incremento di spinta per effetto del sisma su una parete di altezza H viene determinata con la seguente espressione:

$$\Delta S_E = K_h \gamma H^2$$

## 19 COMBINAZIONI DI CARICO

Le condizioni di carico considerate per lo scatolare sono le seguenti:

- Peso proprio
- Spinta terreno sinistra
- Spinta terreno destra
- Sisma da sinistra
- Sisma da destra

**S\_VAR\_SX** Spinta delle terre sulla parete di destra

**VAR** Sovraccarichi variabili sulla soletta superiore

**TERM. (+)/(-)** Azione termica

**FRE** Frenamento

### Riepilogo condizioni di carico per lo scatolare

Si riportano di seguito le combinazioni di carico ritenute più significative con i coefficienti di combinazione  $\gamma \cdot \psi$ . Essendo la struttura simmetrica, si adottano tipologie di combinazione asimmetriche in modo da massimizzare le sollecitazioni. Il dimensionamento delle armature e le verifiche strutturali verranno poi eseguite tenendo conto della simmetria e verificando le condizioni peggiori per ogni lato della struttura.

## 20 RISULTATI, ANALISI E VERIFICHE

### 20.1 MODELLO DI CALCOLO

Di seguito di riporta una descrizione della modellazione effettuata mediante ausilio del software di calcolo SCAT v.11 prodotto dalla AZTEC Informativa, con una descrizione del modello strutturale implementato.  
Di seguito di riporta una descrizione del modello geometrico/geotecnico considerato ai fini del dimensionamento.

Modello Geometrico Geotecnico di Riferimento – 1/2

Modello Geometrico Geotecnico di Riferimento – 2/2

## **TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

A partire dal tipo di terreno, dalla geometria e dai sovraccarichi agenti il programma è in grado di conoscere tutti i carichi agenti sulla struttura per ogni combinazione di carico.

La struttura scatolare viene schematizzata come un telaio piano e viene risolta mediante il metodo degli elementi finiti (FEM). Più dettagliatamente il telaio viene discretizzato in una serie di elementi connessi fra di loro nei nodi.

Il terreno di fondazione viene schematizzato con una serie di elementi molle non reagenti a trazione (modello di Winkler). L'area della singola molla è direttamente proporzionale alla costante di Winkler del terreno e all'area di influenza della molla stessa.

A partire dalla matrice di rigidezza del singolo elemento,  $K_e$ , si assembla la matrice di rigidezza di tutta la struttura  $K$ . Tutti i carichi agenti sulla struttura vengono trasformati in carichi nodali (reazioni di incastro perfetto) ed inseriti nel vettore dei carichi nodali  $p$ .

Indicando con  $u$  il vettore degli spostamenti nodali (incogniti), la relazione risolutiva può essere scritta nella forma

$$K \cdot u = p$$

Da questa equazione matriciale si ricavano gli spostamenti incogniti  $u$

$$u = K^{(-1)} p$$

Noti gli spostamenti nodali è possibile risalire alle sollecitazioni nei vari elementi.

La soluzione del sistema viene fatta per ogni combinazione di carico agente sullo scatolare. Il successivo calcolo delle armature nei vari elementi viene condotto tenendo conto delle condizioni più gravose che si possono verificare nelle sezioni fra tutte le combinazioni di carico.

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

**20.2 SOLLECITAZIONI DI CALCOLO**

Si riportano, di seguito, i diagrammi di involuppo delle caratteristiche delle sollecitazioni di Flessione, Taglio e Sforzo Normale della combinazione più gravosa (INV\_SLU-SISMA); le unità di misura dei grafici sono i KN e m.

22.360 kNm

**Inviluppo diagrammi del momento flettente – SLU statico e sismico**

33.116 kN

**Inviluppo diagrammi del taglio – SLU statico e sismico**

127.720 kN

**Inviluppo diagrammi dello sforzo normale – SLU statico e sismico**

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

22.360 kNm

**Inviluppo diagrammi del momento flettente – SLE**

33.116 kN

**Inviluppo diagrammi del taglio – SLE**

127.720 kN

**Inviluppo diagrammi dello sforzo normale – SLE**

Si precisa nuovamente che, la non simmetria del diagramma è legata all'aver considerato combinazioni di carico emisimmetriche.

### 20.3 ARMATURE DI PROGETTO

Nella tabella seguente si riportano le armature di progetto previste per la sezione di calcolo in questione, come desumibili dagli elaborati grafici di armatura delle opere relative:

<i>Elemento</i>	<b>Armatura a flessione</b>		<b>Armatura a taglio</b>
	<b>Af 1</b>	<b>Af 2</b>	<b>Af t</b>
-	1 $\phi$ 12/20	1 $\phi$ 12/20	

**Af1** : Armatura lato esterno (terreno)

**Af2** : Armatura lato interno

**Aft**: Armatura a taglio

Ai fini delle verifiche si è fatto riferimento ad un copriferro di calcolo (asse armature) pari a 3.6 cm e un copriferro filo esterno armature pari a 3 cm.

Si evidenzia inoltre che le sollecitazioni di progetto non hanno richiesto una specifica armatura a taglio, essendo già soddisfatte le verifiche condotte con previsti dal DM 17.01.18 per le strutture non armate a taglio; è stata comunque prevista un'armatura di collegamento trasversale 1 $\phi$ 6/40x40.

## 20.5 RISULTATI VERIFICHE (STR)

Il software esegue in automatico tutte le verifiche strutturali sia allo stato limite ultimo che allo stato limite di esercizio. Per quanto riguarda il taglio il programma prevede sia la verifica per elementi non armati a taglio e sia quella per elementi dotati di apposita armatura a taglio, disponendo, tuttavia, ferri sagomati resistenti a taglio e non staffe o tiranti. Per questo motivo le verifiche a taglio vengono eseguite manualmente attraverso l'ausilio di fogli di calcolo strutturati ad hoc.

I criteri generali di verifica adottati dal Software sono quelli esposti al Capitolo 7.

Le verifiche esposte fanno riferimento alla sezione maggiormente sollecitata lungo l'intero tombino circolare.

In virtù della particolare forma della sezione, il software suddivide la stessa in due elementi, ovvero l'elemento trasverso (semicirconferenza superiore) e l'elemento fondazione (semicirconferenza inferiore), per ciascuna dei quali sono state considerate 5 sezioni di verifica.

### 20.5.1 Verifiche allo SLU

Nel seguente paragrafo si riportano le verifiche a flessione e a taglio.

#### 20.5.1.1 Verifica a flessione

Si mostrano, nelle seguenti tabelle, le verifiche SLU nei confronti della flessione. Si riportano per semplicità le verifiche più gravose per la struttura.

*Simbologia adottata ed unità di misura*

*X* Ascissa/Ordinata sezione, espresso in cm

*A<sub>fi</sub>* Area armatura inferiore, espresse in cm<sup>2</sup>

*A<sub>fs</sub>* Area armatura superiore, espresse in cm<sup>2</sup>

*CS* Coeff. di sicurezza sezione

#### Inviluppo verifiche stato limite ultimo (SLU)

##### Verifica sezioni fondazione (Inviluppo)

Base sezione B = 100 cm

Altezza sezione H = 16.00 cm

X	A <sub>fi</sub>	A <sub>fs</sub>	CS
0.08	5.65	5.65	2.83
0.48	5.65	5.65	10.58
0.91	5.65	5.65	4.81
1.34	5.65	5.65	6.50
1.74	5.65	5.65	2.87

##### Verifica sezioni trasverso (Inviluppo)

Base sezione B = 100 cm

Altezza sezione H = 16.00 cm

X	A <sub>fi</sub>	A <sub>fs</sub>	CS
0.08	5.65	5.65	2.99
0.48	5.65	5.65	1.97
0.91	5.65	5.65	1.63
1.34	5.65	5.65	2.20
1.74	5.65	5.65	2.72

### 20.5.1.2 Verifica a taglio

I risultati ottenuti dalle verifiche delle sezioni maggiormente sollecitate per la struttura in esame sono riepilogati nella seguente tabella.

Sezione	b	h	V <sub>Ed</sub>	V <sub>RSd</sub> *	V <sub>Rcd</sub>	Verificato
[-]	[cm]	[cm]	[kN]	[kN]	[kN]	[-]
-	100	16	23.98	-	50.57	SI

### 20.5.2 Verifiche allo SLE

Nel seguente paragrafo si riportano le verifiche allo stato limite di apertura delle fessure e le verifiche delle tensioni per il calcestruzzo e per l'acciaio di armatura.

#### 20.5.2.1 Verifica a fessurazione

Nella seguente figura vengono riportati lo schema con indicazione delle zone della struttura ove si innesca il processo di fessurazione:

Schema con indicazione delle zone fessurate

A seguire i relativi valori di ampiezza delle fessure ricavati per la combinazione frequente e quasi permanente

### Verifiche fessurazione

Simbologia adottata ed unità di misura

N° Indice sezione

X<sub>i</sub> Ascissa/Ordinata sezione, espresso in m

L'ampiezza delle fessure è sempre al di sotto dei limiti sopra descritti, pertanto, le verifiche si possono ritenere soddisfatte.

**20.5.2.2 Verifica delle tensioni**

Nella seguente tabella sono riportati i risultati delle verifiche allo SLE dei limiti tensionali di lavoro nel calcestruzzo e nelle barre di armatura.

Tali tensioni risultano sempre al di sotto dei limiti indicati dalla normativa, pertanto, le verifiche si possono ritenere soddisfatte. Vengono riportate le verifiche più gravose.

**Verifiche combinazioni SLE**

Simbologia adottata ed unità di misura

N° Indice sezione

X Ascissa/Ordinata sezione, espresso in m

M Momento flettente, espresso in kNm

V Taglio, espresso in kN

N Sforzo normale, espresso in kN

A<sub>fi</sub> Area armatura inferiore, espressa in cmq

A<sub>fs</sub> Area armatura superiore, espressa in cmq

σ<sub>fs</sub> Tensione nell'armatura disposta in corrispondenza del lembo inferiore, espressa in MPa

σ<sub>fi</sub> Tensione nell'armatura disposta in corrispondenza del lembo superiore, espressa in MPa

σ<sub>c</sub> Tensione nel calcestruzzo, espressa in MPa

τ<sub>c</sub> Tensione tangenziale nel calcestruzzo, espressa in MPa

A<sub>sv</sub> Area armature trasversali nella sezione, espressa in cmq

**Verifica sezioni fondazione [Combinazione n° 19 - SLE (Quasi Permanente)]**

Base sezione B = 100 cm

Altezza sezione H = 16.00 cm

## 20.6 RISULTATI VERIFICHE (GEO)

Il software esegue in automatico tutte le verifiche geotecniche sia allo stato limite ultimo che allo stato limite di esercizio. I criteri generali di verifica adottati dal Software sono quelli esposti al Capitolo 8.

### 20.6.1 Verifica a Stato limite di esercizio

Nei paragrafi seguenti sono riportati i tabulati con le pressioni di contatto fondazione-terreno e i cedimenti attesi.

#### 20.6.1.1 Pressioni di contatto fondazione-terreno

Le pressioni di contatto terreno-fondazione sono ricavate con riferimento all'involuppo dello Stato limite di esercizio.

##### Involuppo pressioni sul terreno di fondazione

X [m]	$\sigma_{\min}$ [MPa]	$\sigma_{\max}$ [MPa]
0.08	0.071	0.138
0.48	0.080	0.145
0.91	0.090	0.152
1.34	0.090	0.160
1.74	0.090	0.167

#### 20.6.1.2 Cedimenti attesi

I cedimenti attesi sono ricavati per la fondazione con riferimento alla combinazione rara dello Stato limite di esercizio.

##### Spostamenti fondazione (Combinazione n° 22)

X [m]	$u_x$ [cm]	$u_y$ [cm]
0.08	0.778	4.333

### 20.6.1.3 Verifica a carico limite

Nel paragrafo seguente sono riportati i tabulati con la verifica a carico limite.

La verifica a carico limite è stata eseguita in automatico dal software di calcolo attraverso l'utilizzo della formula di Meyerhof, come già specificato in precedenza; nel seguito si riportano i risultati ottenuti per il caso in esame:

## Verifiche geotecniche

### Simbologia adottata

*IC* Indice della combinazione

*N<sub>c</sub>, N<sub>q</sub>, N<sub>γ</sub>* Fattori di capacità portante

*N<sub>c</sub>, N<sub>q</sub>, N<sub>γ</sub>* Fattori di capacità portante corretti per effetto forma, inclinazione del carico, affondamento, etc.

*q<sub>u</sub>* Portanza ultima del terreno, espressa in [MPa]

*Q<sub>v</sub>* Portanza ultima del terreno, espressa in [kN]/m

*Q<sub>y</sub>* Carico verticale al piano di posa, espressa in [kN]/m

*FS* Fattore di sicurezza a carico limite

IC	N <sub>c</sub>	N <sub>q</sub>	N <sub>γ</sub>	N' <sub>c</sub>	N' <sub>q</sub>	N' <sub>γ</sub>	q <sub>u</sub>	Q <sub>v</sub>	Q <sub>y</sub>	FS
