**TABULATI DI INPUT E OUTPUT TOMBINO  $\Phi 1500$  (RICOPR. = 0.60 M)**

**Calcolo del carico sulla calotta**

**Pressione Geostatica**

In questo caso la pressione in calotta viene calcolata come prodotto tra il peso di volume del terreno per l'altezza del ricoprimento (Spessore dello strato di terreno superiore). Quindi la pressione in calotta è fornita dalla seguente relazione:

$$P_v = \gamma H$$

Se sul profilo del piano campagna sono presenti dei sovraccarichi, concentrati e/o distribuiti, la diffusione di questi nel terreno avviene secondo un angolo, rispetto alla verticale, pari a 35.00°.

**Spinta sui piedritti**

**Spinta attiva - Metodo di Coulomb**

La teoria di Coulomb considera l'ipotesi di un cuneo di spinta a monte della parete che si muove rigidamente lungo una superficie di rottura rettilinea. Dall'equilibrio del cuneo si ricava la spinta che il terreno esercita sull'opera di sostegno. In particolare Coulomb ammette, al contrario della teoria di Rankine, l'esistenza di attrito fra il terreno e la parete, e quindi la retta di spinta risulta inclinata rispetto alla normale alla parete stesso di un angolo di attrito terra-parete.

L'espressione della spinta esercitata da un terrapieno, di peso di volume  $\gamma$ , su una parete di altezza  $H$ , risulta espressa secondo la teoria di Coulomb dalla seguente relazione (per terreno incoerente)

$$S = 1/2 \gamma H^2 K_a$$

$K_a$  rappresenta il coefficiente di spinta attiva di Coulomb nella versione riveduta da Muller-Breslau, espresso come

$$K_a = \frac{\sin(\alpha + \phi)}{\sin^2 \alpha \sin(\alpha - \delta) \left[ 1 + \frac{\sqrt{[\sin(\phi + \delta) \sin(\phi - \beta)]}}{\sqrt{[\sin(\alpha - \delta) \sin(\alpha + \beta)]}} \right]^2}$$

dove  $\phi$  è l'angolo d'attrito del terreno,  $\alpha$  rappresenta l'angolo che la parete forma con l'orizzontale ( $\alpha = 90^\circ$  per parete verticale),  $\delta$  è l'angolo d'attrito terreno-parete,  $\beta$  è l'inclinazione del terrapieno rispetto all'orizzontale.

La spinta risulta inclinata dell'angolo d'attrito terreno-parete  $\delta$  rispetto alla normale alla parete.

Il diagramma delle pressioni del terreno sulla parete risulta triangolare con il vertice in alto. Il punto di applicazione della spinta si trova in corrispondenza del baricentro del diagramma delle pressioni ( $1/3 H$  rispetto alla base della parete). L'espressione di  $K_a$  perde di significato per  $\beta > \phi$ . Questo coincide con quanto si intuisce fisicamente: la pendenza del terreno a monte della parete non può superare l'angolo di natural declivio del terreno stesso.

Nel caso di terreno dotato di attrito e coesione  $c$  l'espressione della pressione del terreno ad una generica profondità  $z$  vale

$$\sigma_a = \gamma z K_a - 2 c \sqrt{K_a}$$

**Spinta in presenza di falda**

Nel caso in cui a monte della parete sia presente la falda il diagramma delle pressioni sulla parete risulta modificato a causa della sottospinta che l'acqua esercita sul terreno. Il peso di volume del terreno al di sopra della linea di falda non subisce variazioni. Viceversa al di sotto del livello di falda va considerato il peso di volume di galleggiamento

$$\gamma_a = \gamma_{sat} - \gamma_w$$

dove  $\gamma_{\text{sat}}$  è il peso di volume saturo del terreno (dipendente dall'indice dei pori) e  $\gamma_w$  è il peso di volume dell'acqua. Quindi il diagramma delle pressioni al di sotto della linea di falda ha una pendenza minore. Al diagramma così ottenuto va sommato il diagramma triangolare legato alla pressione idrostatica esercitata dall'acqua.

## Spinta a Riposo

Si assume che sui piedritti agisca la spinta calcolata in condizioni di riposo.  
Il coefficiente di spinta a riposo è espresso dalla relazione

$$K_0 = 1 - \sin\phi$$

dove  $\phi$  rappresenta l'angolo d'attrito interno del terreno di rinfianco.

Quindi la pressione laterale, ad una generica profondità  $z$  e la spinta totale sulla parete di altezza  $H$  valgono

$$\sigma = \gamma z K_0 + p_v K_0$$

$$S = 1/2 \gamma H^2 K_0 + p_v K_0 H$$

dove  $p_v$  è la pressione verticale agente in corrispondenza della calotta.

## Spinta in presenza di sisma - Formula di Wood

Spinta del terreno nel caso di strutture rigide.

Nel caso di strutture rigide completamente vincolate, in modo tale che non può svilupparsi nel terreno uno stato di spinta attiva, nonché nel caso di muri verticali con terrapieno a superficie orizzontale, l'incremento dinamico di spinta del terreno può essere calcolato come:

$$\Delta P_d = \alpha \gamma H^2$$

$$\alpha = a_g / g * S_s * \beta_m * S_t$$

$H$  è l'altezza sulla quale agisce la spinta. Il punto di applicazione va preso a metà altezza.

## Verifica al carico limite

Il rapporto fra il carico limite in fondazione e la componente normale della risultante dei carichi trasmessi dal muro sul terreno di fondazione deve essere superiore a  $\eta_q$ . Cioè, detto  $Q_u$ , il carico limite ed  $R$  la risultante verticale dei carichi in fondazione, deve essere:

$$\frac{Q_u}{R} \geq \eta_q$$

Si adotta per il calcolo del carico limite in fondazione il metodo di MEYERHOF.

L'espressione del carico ultimo è data dalla relazione:

$$Q_u = c N_c d_c i_c + q N_q d_q i_q + 0.5 \gamma B N_\gamma d_\gamma i_\gamma$$

In questa espressione

- $c$  coesione del terreno in fondazione;
- $\phi$  angolo di attrito del terreno in fondazione;
- $\gamma$  peso di volume del terreno in fondazione;
- $B$  larghezza della fondazione;
- $D$  profondità del piano di posa;
- $q$  pressione geostatica alla quota del piano di posa.

I vari fattori che compaiono nella formula sono dati da:

$$A = e^{\pi \operatorname{tg} \phi}$$

$$N_q = A \operatorname{tg}^2(45^\circ + \phi/2)$$

$$N_c = (N_q - 1) \operatorname{ctg} \phi$$

$$N_\gamma = (N_q - 1) \operatorname{tg} (1.4\phi)$$

Indichiamo con  $K_p$  il coefficiente di spinta passiva espresso da:

$$K_p = \operatorname{tg}^2(45^\circ + \phi/2)$$

I fattori  $d$  e  $i$  che compaiono nella formula sono rispettivamente i fattori di profondità ed i fattori di inclinazione del carico espressi dalle seguenti relazioni:

Fattori di profondità

$$d_q = 1 + 0.2 \frac{D}{B} \sqrt{K_p}$$

$$d_q = d_\gamma = 1 \quad \text{per } \phi = 0$$

$$d_q = d_\gamma = 1 + 0.1 \frac{D}{B} \sqrt{K_p} \quad \text{per } \phi > 0$$

Fattori di inclinazione

Indicando con  $\theta$  l'angolo che la risultante dei carichi forma con la verticale ( espresso in gradi ) e con  $\phi$  l'angolo d'attrito del terreno di posa abbiamo:

$$i_c = i_q = (1 - \theta^\circ/90)^\circ$$

$$i_\gamma = (1 - \frac{\theta^\circ}{\phi^\circ})^\circ \quad \text{per } \phi > 0$$

$$i_\gamma = 0 \quad \text{per } \phi = 0$$

## Strategia di soluzione

A partire dal tipo di terreno, dalla geometria e dai sovraccarichi agenti il programma è in grado di conoscere tutti i carichi agenti sulla struttura per ogni combinazione di carico.

La struttura scatolare viene schematizzata come un telaio piano e viene risolta mediante il metodo degli elementi finiti (FEM). Più dettagliatamente il telaio viene discretizzato in una serie di elementi connessi fra di loro nei nodi.

Il terreno di rinfianco e di fondazione viene invece schematizzato con una serie di elementi molle non reagenti a trazione (modello di Winkler). L'area della singola molla è direttamente proporzionale alla costante di Winkler del terreno e all'area di influenza della molla stessa.

A partire dalla matrice di rigidezza del singolo elemento,  $K_e$ , si assembla la matrice di rigidezza di tutta la struttura  $K$ . Tutti i carichi agenti sulla struttura vengono trasformati in carichi nodali (reazioni di incastro perfetto) ed inseriti nel vettore dei carichi nodali  $p$ .

Indicando con  $u$  il vettore degli spostamenti nodali (incogniti), la relazione risolutiva può essere scritta nella forma

$$K u = p$$

Da questa equazione matriciale si ricavano gli spostamenti incogniti  $u$

$$u = K^{-1} p$$

Noti gli spostamenti nodali è possibile risalire alle sollecitazioni nei vari elementi.

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

La soluzione del sistema viene fatta per ogni combinazione di carico agente sullo scatolare. Il successivo calcolo delle armature nei vari elementi viene condotto tenendo conto delle condizioni più gravose che si possono verificare nelle sezioni fra tutte le combinazioni di carico.

## Geometria scatolare

Descrizione:	Scatolare circolare		
Diametro esterno verticale	1.82	[m]	
Diametro esterno orizzontale	1.82	[m]	
Spessore	0.16	[m]	

## Caratteristiche strati terreno

### Strato di ricoprimento

## Analisi della spinta e verifiche

### *Simbologia adottata ed unità di misura*

Origine in corrispondenza dello spigolo inferiore sinistro della struttura  
Le forze orizzontali sono considerate positive se agenti verso destra  
Le forze verticali sono considerate positive se agenti verso il basso  
 $X$  ascisse (esprese in m) positive verso destra  
 $Y$  ordinate (esprese in m) positive verso l'alto  
 $M$  momento espresso in kNm  
 $V$  taglio espresso in kN  
 $SN$  sforzo normale espresso in kN  
 $ux$  spostamento direzione  $X$  espresso in cm  
 $uy$  spostamento direzione  $Y$  espresso in cm  
 $\sigma$  pressione sul terreno espressa in MPa

## Verifiche combinazioni SLU

Simbologia adottata ed unità di misura

N° Indice sezione

X Ascissa/Ordinata sezione, espresso in cm

M Momento flettente, espresso in kNm

V Taglio, espresso in kN

N Sforzo normale, espresso in kN

N<sub>u</sub> Sforzo normale ultimo, espressa in kN

M<sub>u</sub> Momento ultimo, espressa in kNm

A<sub>B</sub> Area armatura inferiore, espressa in cmq

A<sub>S</sub> Area armatura superiore, espressa in cmq

CS Coeff. di sicurezza sezione

V<sub>Rd</sub> Aliquota taglio assorbita dal calcestruzzo in elementi senza armature trasversali, espressa in kN

V<sub>Rcd</sub> Aliquota taglio assorbita dal calcestruzzo in elementi con armature trasversali, espressa in kN

V<sub>Rsd</sub> Aliquota taglio assorbita armature trasversali, espressa in kN

A<sub>sw</sub> Area armature trasversali nella sezione, espressa in cmq

### Verifica sezioni fondazione [Combinazione n° 1 - SLU (Caso A1-M1)]

Base sezione B = 100 cm

Altezza sezione H = 16.00 cm

## Verifiche combinazioni SLE

Simbologia adottata ed unità di misura

N° Indice sezione

X Ascissa/Ordinata sezione, espresso in m

M Momento flettente, espresso in kNm

V Taglio, espresso in kN

N Sforzo normale, espresso in kN

A<sub>f</sub> Area armatura inferiore, espressa in cmq

A<sub>s</sub> Area armatura superiore, espressa in cmq

σ<sub>f</sub> Tensione nell'armatura disposta in corrispondenza del lembo inferiore, espressa in MPa

σ<sub>s</sub> Tensione nell'armatura disposta in corrispondenza del lembo superiore, espressa in MPa

σ<sub>c</sub> Tensione nel calcestruzzo, espressa in MPa

τ<sub>c</sub> Tensione tangenziale nel calcestruzzo, espressa in MPa

A<sub>sw</sub> Area armature trasversali nella sezione, espressa in cmq

### Verifica sezioni fondazione [Combinazione n° 19 - SLE (Quasi Permanente)]

Base sezione B = 100 cm

Altezza sezione H = 16.00 cm

## Verifiche fessurazione

Simbologia adottata ed unità di misura

$N^{\circ}$  Indice sezione

$X_i$  Ascissa/Ordinata sezione, espresso in m

$M_p$  Momento, espresse in kNm

$M_n$  Momento, espresse in kNm

$w_k$  Ampiezza fessure, espresse in mm

$w_{lim}$  Apertura limite fessure, espresse in mm

$s$  Distanza media tra le fessure, espresse in mm

$\epsilon_{sm}$  Deformazione nelle fessure, espresse in [%]

### Verifica fessurazione fondazione [Combinazione n° 19 - SLE (Quasi Permanente)]

## Verifiche geotecniche

### Simbologia adottata

IC Indice della combinazione

$N_c, N_q, N_\gamma$  Fattori di capacità portante

$N_c, N_q, N_\gamma$  Fattori di capacità portante corretti per effetto forma, inclinazione del carico, affondamento, etc.

$q_u$  Portanza ultima del terreno, espressa in [MPa]

$Q_v$  Portanza ultima del terreno, espressa in [kN]/m

$Q_v$  Carico verticale al piano di posa, espressa in [kN]/m

FS Fattore di sicurezza a carico limite

**TABULATI DI INPUT E OUTPUT TOMBINO  $\Phi 1500$  (RICOPR. = 3.50 M)**

**Calcolo del carico sulla calotta**

**Pressione Geostatica**

In questo caso la pressione in calotta viene calcolata come prodotto tra il peso di volume del terreno per l'altezza del ricoprimento (Spessore dello strato di terreno superiore). Quindi la pressione in calotta è fornita dalla seguente relazione:

$$P_v = \gamma H$$

Se sul profilo del piano campagna sono presenti dei sovraccarichi, concentrati e/o distribuiti, la diffusione di questi nel terreno avviene secondo un angolo, rispetto alla verticale, pari a 35.00°.

**Spinta sui piedritti**

**Spinta attiva - Metodo di Coulomb**

La teoria di Coulomb considera l'ipotesi di un cuneo di spinta a monte della parete che si muove rigidamente lungo una superficie di rottura rettilinea. Dall'equilibrio del cuneo si ricava la spinta che il terreno esercita sull'opera di sostegno. In particolare Coulomb ammette, al contrario della teoria di Rankine, l'esistenza di attrito fra il terreno e la parete, e quindi la retta di spinta risulta inclinata rispetto alla normale alla parete stesso di un angolo di attrito terra-parete.

L'espressione della spinta esercitata da un terrapieno, di peso di volume  $\gamma$ , su una parete di altezza  $H$ , risulta espressa secondo la teoria di Coulomb dalla seguente relazione (per terreno incoerente)

$$S = 1/2 \gamma H^2 K_a$$

$K_a$  rappresenta il coefficiente di spinta attiva di Coulomb nella versione riveduta da Muller-Breslau, espresso come

$$K_a = \frac{\sin(\alpha + \phi)}{\sin^2 \alpha \sin(\alpha - \delta) \left[ 1 + \frac{\sqrt{[\sin(\phi + \delta) \sin(\phi - \beta)]}}{\sqrt{[\sin(\alpha - \delta) \sin(\alpha + \beta)]}} \right]^2}$$

dove  $\phi$  è l'angolo d'attrito del terreno,  $\alpha$  rappresenta l'angolo che la parete forma con l'orizzontale ( $\alpha = 90^\circ$  per parete verticale),  $\delta$  è l'angolo d'attrito terreno-parete,  $\beta$  è l'inclinazione del terrapieno rispetto all'orizzontale.

La spinta risulta inclinata dell'angolo d'attrito terreno-parete  $\delta$  rispetto alla normale alla parete.

Il diagramma delle pressioni del terreno sulla parete risulta triangolare con il vertice in alto. Il punto di applicazione della spinta si trova in corrispondenza del baricentro del diagramma delle pressioni ( $1/3 H$  rispetto alla base della parete). L'espressione di  $K_a$  perde di significato per  $\beta > \phi$ . Questo coincide con quanto si intuisce fisicamente: la pendenza del terreno a monte della parete non può superare l'angolo di natural declivio del terreno stesso.

Nel caso di terreno dotato di attrito e coesione  $c$  l'espressione della pressione del terreno ad una generica profondità  $z$  vale

$$\sigma_a = \gamma z K_a - 2 c \sqrt{K_a}$$

**Spinta in presenza di falda**

Nel caso in cui a monte della parete sia presente la falda il diagramma delle pressioni sulla parete risulta modificato a causa della sottospinta che l'acqua esercita sul terreno. Il peso di volume del terreno al di sopra della linea di falda non subisce variazioni. Viceversa al di sotto del livello di falda va considerato il peso di volume di galleggiamento

$$\gamma_a = \gamma_{sat} - \gamma_w$$

dove  $\gamma_{sat}$  è il peso di volume saturo del terreno (dipendente dall'indice dei pori) e  $\gamma_w$  è il peso di volume dell'acqua. Quindi il diagramma delle pressioni al di sotto della linea di falda ha una pendenza minore. Al diagramma così ottenuto va sommato il diagramma triangolare legato alla pressione idrostatica esercitata dall'acqua.

## Spinta a Riposo

Si assume che sui piedritti agisca la spinta calcolata in condizioni di riposo.  
Il coefficiente di spinta a riposo è espresso dalla relazione

$$K_0 = 1 - \sin\phi$$

dove  $\phi$  rappresenta l'angolo d'attrito interno del terreno di rinfianco.

Quindi la pressione laterale, ad una generica profondità  $z$  e la spinta totale sulla parete di altezza  $H$  valgono

$$\sigma = \gamma z K_0 + p_v K_0$$

$$S = 1/2 \gamma H^2 K_0 + p_v K_0 H$$

dove  $p_v$  è la pressione verticale agente in corrispondenza della calotta.

## Spinta in presenza di sisma - Formula di Wood

Spinta del terreno nel caso di strutture rigide.

Nel caso di strutture rigide completamente vincolate, in modo tale che non può svilupparsi nel terreno uno stato di spinta attiva, nonché nel caso di muri verticali con terrapieno a superficie orizzontale, l'incremento dinamico di spinta del terreno può essere calcolato come:

$$\Delta P_d = \alpha \gamma H^2$$

$$\alpha = a_g / g * S_s * \beta_m * S_t$$

$H$  è l'altezza sulla quale agisce la spinta. Il punto di applicazione va preso a metà altezza.

## Verifica al carico limite

Il rapporto fra il carico limite in fondazione e la componente normale della risultante dei carichi trasmessi dal muro sul terreno di fondazione deve essere superiore a  $\eta_q$ . Cioè, detto  $Q_u$ , il carico limite ed  $R$  la risultante verticale dei carichi in fondazione, deve essere:

$$\frac{Q_u}{R} \geq \eta_q$$

Si adotta per il calcolo del carico limite in fondazione il metodo di MEYERHOF.

L'espressione del carico ultimo è data dalla relazione:

$$Q_u = c N_c d_c i_c + q N_q d_q i_q + 0.5 \gamma B N_\gamma d_\gamma i_\gamma$$

In questa espressione

- $c$  coesione del terreno in fondazione;
- $\phi$  angolo di attrito del terreno in fondazione;
- $\gamma$  peso di volume del terreno in fondazione;
- $B$  larghezza della fondazione;
- $D$  profondità del piano di posa;
- $q$  pressione geostatica alla quota del piano di posa.

I vari fattori che compaiono nella formula sono dati da:

$$A = e^{\pi \operatorname{tg} \phi}$$

$$N_q = A \operatorname{tg}^2(45^\circ + \phi/2)$$

$$N_c = (N_q - 1) \operatorname{ctg} \phi$$

$$N_\gamma = (N_q - 1) \operatorname{tg} (1.4\phi)$$

Indichiamo con  $K_p$  il coefficiente di spinta passiva espresso da:

$$K_p = \operatorname{tg}^2(45^\circ + \phi/2)$$

I fattori  $d$  e  $i$  che compaiono nella formula sono rispettivamente i fattori di profondità ed i fattori di inclinazione del carico espressi dalle seguenti relazioni:

Fattori di profondità

$$d_q = 1 + 0.2 \frac{D}{B} \sqrt{K_p}$$

$$d_q = d_\gamma = 1 \quad \text{per } \phi = 0$$

$$d_q = d_\gamma = 1 + 0.1 \frac{D}{B} \sqrt{K_p} \quad \text{per } \phi > 0$$

Fattori di inclinazione

Indicando con  $\theta$  l'angolo che la risultante dei carichi forma con la verticale ( espresso in gradi ) e con  $\phi$  l'angolo d'attrito del terreno di posa abbiamo:

$$i_c = i_q = (1 - \theta/90)^2$$

$$i_\gamma = \left(1 - \frac{\theta}{\phi}\right)^2 \quad \text{per } \phi > 0$$

$$i_\gamma = 0 \quad \text{per } \phi = 0$$

## Strategia di soluzione

A partire dal tipo di terreno, dalla geometria e dai sovraccarichi agenti il programma è in grado di conoscere tutti i carichi agenti sulla struttura per ogni combinazione di carico.

La struttura scatolare viene schematizzata come un telaio piano e viene risolta mediante il metodo degli elementi finiti (FEM). Più dettagliatamente il telaio viene discretizzato in una serie di elementi connessi fra di loro nei nodi.

Il terreno di rinfianco e di fondazione viene invece schematizzato con una serie di elementi molle non reagenti a trazione (modello di Winkler). L'area della singola molla è direttamente proporzionale alla costante di Winkler del terreno e all'area di influenza della molla stessa.

A partire dalla matrice di rigidezza del singolo elemento,  $K_e$ , si assembla la matrice di rigidezza di tutta la struttura  $K$ . Tutti i carichi agenti sulla struttura vengono trasformati in carichi nodali (reazioni di incastro perfetto) ed inseriti nel vettore dei carichi nodali  $p$ .

Indicando con  $u$  il vettore degli spostamenti nodali (incogniti), la relazione risolutiva può essere scritta nella forma

$$K u = p$$

Da questa equazione matriciale si ricavano gli spostamenti incogniti  $u$

$$u = K^{-1} p$$

Noti gli spostamenti nodali è possibile risalire alle sollecitazioni nei vari elementi.

**TOMBINI CIRCOLARI – RELAZIONE DESCRITTIVA E DI CALCOLO**

La soluzione del sistema viene fatta per ogni combinazione di carico agente sullo scatolare. Il successivo calcolo delle armature nei vari elementi viene condotto tenendo conto delle condizioni più gravose che si possono verificare nelle sezioni fra tutte le combinazioni di carico.

## Geometria scatolare

Descrizione:	Scatolare circolare	
Diametro esterno verticale	1.82	[m]
Diametro esterno orizzontale	1.82	[m]
Spessore	0.16	[m]

## Caratteristiche strati terreno

### Strato di ricoprimento

Descrizione	Terreno di ricoprimento	
Spessore dello strato	3.50	[m]
Peso di volume	20.0000	[kN/mc]
Peso di volume saturo	21.0000	[kN/mc]
Angolo di attrito	35.00	[°]
Coesione	0.000	[MPa]

### Strato di rinfiacco

Descrizione	Terreno di rinfiacco	
Peso di volume	19.0000	[kN/mc]
Peso di volume saturo	20.0000	[kN/mc]
Angolo di attrito	22.00	[°]
Angolo di attrito terreno struttura	14.67	[°]
Coesione	0.004	[MPa]
Costante di Winkler	0.000	[MPa/cm]

### Strato di base

Descrizione	Terreno di base	
Peso di volume	19.0000	[kN/mc]
Peso di volume saturo	20.0000	[kN/mc]
Angolo di attrito	22.00	[°]
Angolo di attrito terreno struttura	22.00	[°]
Coesione	0.004	[MPa]
Costante di Winkler	0.024	[MPa/cm]
Tensione limite	6.000	[MPa]

## Caratteristiche materiali utilizzati

### Materiale calcestruzzo

R <sub>ck</sub> calcestruzzo	40.000	[MPa]
Peso specifico calcestruzzo	25.0000	[kN/mc]
Modulo elastico E	33149.080	[MPa]
Tensione di snervamento acciaio	450.000	[MPa]
Coeff. omogeneizzazione cls tesoro/compresso (n')	0.50	
Coeff. omogeneizzazione acciaio/cls (n)	15.00	
Coefficiente dilatazione termica	0.0000120	

### Materiale calcestruzzo trasverso

R <sub>ck</sub> calcestruzzo	30.000	[MPa]
Peso specifico calcestruzzo	24.5170	[kN/mc]
Modulo elastico E	30976.850	[MPa]
Tensione di snervamento acciaio	450.000	[MPa]
Coeff. omogeneizzazione cls tesoro/compresso (n')	0.50	
Coeff. omogeneizzazione acciaio/cls (n)	15.00	
Coefficiente dilatazione termica	0.0000120	

## Condizioni di carico

*Convenzioni adottate*

Elaborato

## Impostazioni di progetto

Verifica materiali:

**Stato Limite Ultimo**

Coefficiente di sicurezza calcestruzzo $\gamma_c$	1.50
Fattore riduzione da resistenza cubica a cilindrica	0.83

Fattore di riduzione per carichi di lungo periodo	0.85
Coefficiente di sicurezza acciaio	1.15
Coefficiente di sicurezza per la sezione	1.00

Verifica Taglio - Metodo dell'inclinazione variabile del traliccio

$$V_{Rd}=[0.18*k*(100.0*\rho_1*f_{ck})^{1/3}/\gamma_c+0.15*\sigma_{cp}]*b_w*d>(v_{min}+0.15*\sigma_{cp})*b_w*d$$

$$V_{Rsd}=0.9*d*A_{sw}/s*f_{yd}*(ctg\alpha+ctg\theta)*\sin\alpha$$

$$V_{Rcd}=0.9*d*b_w*\alpha_c*f_{cd}*(ctg(\theta)+ctg(\alpha))/(1.0+ctg\theta^2)$$

con:

d	altezza utile sezione [mm]
b <sub>w</sub>	larghezza minima sezione [mm]
σ <sub>cp</sub>	tensione media di compressione [N/mmq]
ρ <sub>1</sub>	rapporto geometrico di armatura
A <sub>sw</sub>	area armatura trasversale [mmq]
s	interasse tra due armature trasversali consecutive [mm]
α <sub>c</sub>	coefficiente maggiorativo, funzione di f <sub>cd</sub> e σ <sub>cp</sub>

$$f_{cd}=0.5*f_{cd}$$

$$k=1+(200/d)^{1/2}$$

$$v_{min}=0.035*k^{3/2}*f_{ck}^{1/2}$$

**Stato Limite di Esercizio**

Criteri di scelta per verifiche tensioni di esercizio:

Ambiente moderatamente aggressivo

Limite tensioni di compressione nel calcestruzzo (comb. rare)

0.60 f<sub>ck</sub>

Limite tensioni di compressione nel calcestruzzo (comb. quasi perm.)

0.45 f<sub>ck</sub>

Limite tensioni di trazione nell'acciaio (comb. rare)

0.80 f<sub>yk</sub>

Criteri verifiche a fessurazione:

Armatura poco sensibile

Apertura limite fessure espresse in [mm]

Apertura limite fessure w<sub>1</sub>=0.20 w<sub>2</sub>=0.30 w<sub>3</sub>=0.40

## Descrizione combinazioni di carico

### Simbologia adottata

- $\gamma$  Coefficiente di partecipazione della condizione  
 $\Psi$  Coefficiente di combinazione della condizione  
 $C$  Coefficiente totale di partecipazione della condizione

### Norme Tecniche 2008

### Simbologia adottata

- $\gamma_{G1sfav}$  Coefficiente parziale sfavorevole sulle azioni permanenti  
 $\gamma_{G1fav}$  Coefficiente parziale favorevole sulle azioni permanenti  
 $\gamma_{G2sfav}$  Coefficiente parziale sfavorevole sulle azioni permanenti non strutturali  
 $\gamma_{G2fav}$  Coefficiente parziale favorevole sulle azioni permanenti non strutturali  
 $\gamma_Q$  Coefficiente parziale sulle azioni variabili  
 $\gamma_{tan\phi}$  Coefficiente parziale di riduzione dell'angolo di attrito drenato  
 $\gamma_c$  Coefficiente parziale di riduzione della coesione drenata  
 $\gamma_{cu}$  Coefficiente parziale di riduzione della coesione non drenata  
 $\gamma_{qu}$  Coefficiente parziale di riduzione del carico ultimo

### Coefficienti di partecipazione combinazioni statiche

#### Coefficienti parziali per le azioni o per l'effetto delle azioni:

<i>Carichi</i>	<i>Effetto</i>		<i>A1</i>	<i>A2</i>
Permanenti	Favorevole	$\gamma_{G1fav}$	1.00	1.00
Permanenti	Sfavorevole	$\gamma_{G1sfav}$	1.30	1.00
Permanenti non strutturali	Favorevole	$\gamma_{G2fav}$	0.00	0.00
Permanenti non strutturali	Sfavorevole	$\gamma_{G2sfav}$	1.50	1.30
Variabili	Favorevole	$\gamma_{Q1fav}$	0.00	0.00
Variabili	Sfavorevole	$\gamma_{Q1sfav}$	1.50	1.30
Variabili da traffico	Favorevole	$\gamma_{Qfav}$	0.00	0.00
Variabili da traffico	Sfavorevole	$\gamma_{Qsfav}$	1.50	1.30
Termici	Favorevole	$\gamma_{efav}$	0.00	0.00
Termici	Sfavorevole	$\gamma_{esfav}$	1.50	1.50

#### Coefficienti parziali per i parametri geotecnici del terreno:

<i>Parametri</i>			<i>M1</i>	<i>M2</i>
Tangente dell'angolo di attrito		$\gamma_{tan\phi}$	1.00	1.25
Coesione efficace		$\gamma_c$	1.00	1.25
Resistenza non drenata		$\gamma_{cu}$	1.00	1.40
Resistenza a compressione uniassiale		$\gamma_{qu}$	1.00	1.60
Peso dell'unità di volume		$\gamma_\gamma$	1.00	1.00

### Coefficienti di partecipazione combinazioni sismiche

#### Coefficienti parziali per le azioni o per l'effetto delle azioni:

<i>Carichi</i>	<i>Effetto</i>		<i>A1</i>	<i>A2</i>
Permanenti	Favorevole	$\gamma_{G1fav}$	1.00	1.00
Permanenti	Sfavorevole	$\gamma_{G1sfav}$	1.00	1.00
Permanenti	Favorevole	$\gamma_{G2fav}$	0.00	0.00
Permanenti	Sfavorevole	$\gamma_{G2sfav}$	1.00	1.00
Variabili	Favorevole	$\gamma_{Q1fav}$	0.00	0.00
Variabili	Sfavorevole	$\gamma_{Q1sfav}$	1.00	1.00
Variabili da traffico	Favorevole	$\gamma_{Qfav}$	0.00	0.00
Variabili da traffico	Sfavorevole	$\gamma_{Qsfav}$	1.00	1.00
Termici	Favorevole	$\gamma_{efav}$	0.00	0.00
Termici	Sfavorevole	$\gamma_{esfav}$	1.00	1.00

#### Coefficienti parziali per i parametri geotecnici del terreno:

<i>Parametri</i>			<i>M1</i>	<i>M2</i>
Tangente dell'angolo di attrito		$\gamma_{tan\phi}$	1.00	1.25
Coesione efficace		$\gamma_c$	1.00	1.25
Resistenza non drenata		$\gamma_{cu}$	1.00	1.40
Resistenza a compressione uniassiale		$\gamma_{qu}$	1.00	1.60

## Analisi della spinta e verifiche

### *Simbologia adottata ed unità di misura*

Origine in corrispondenza dello spigolo inferiore sinistro della struttura  
Le forze orizzontali sono considerate positive se agenti verso destra  
Le forze verticali sono considerate positive se agenti verso il basso  
 $X$  ascisse (espresse in m) positive verso destra  
 $Y$  ordinate (espresse in m) positive verso l'alto  
 $M$  momento espresso in kNm  
 $V$  taglio espresso in kN  
 $SN$  sforzo normale espresso in kN  
 $ux$  spostamento direzione  $X$  espresso in cm  
 $uy$  spostamento direzione  $Y$  espresso in cm  
 $\sigma$  pressione sul terreno espressa in MPa

### Tipo di analisi

Pressione in calotta

I carichi applicati sul terreno sono stati diffusi secondo **angolo di attrito**  
Metodo di calcolo della portanza

### Spinta sui piedritti

Pressione geostatica

Meyerhof

N° Indice sezione

X Ascissa/Ordinata sezione, espresso in cm

M Momento flettente, espresso in kNm

V Taglio, espresso in kN

N Sforzo normale, espresso in kN

N<sub>u</sub> Sforzo normale ultimo, espressa in kN

M<sub>u</sub> Momento ultimo, espressa in kNm

A<sub>B</sub> Area armatura inferiore, espressa in cmq

A<sub>S</sub> Area armatura superiore, espressa in cmq

CS Coeff. di sicurezza sezione

V<sub>Rd</sub> Aliquota taglio assorbita dal calcestruzzo in elementi senza armature trasversali, espressa in kN

V<sub>Rcd</sub> Aliquota taglio assorbita dal calcestruzzo in elementi con armature trasversali, espressa in kN

V<sub>Rsd</sub> Aliquota taglio assorbita armature trasversali, espressa in kN

A<sub>sw</sub> Area armature trasversali nella sezione, espressa in cmq

### Verifica sezioni fondazione [Combinazione n° 1 - SLU (Caso A1-M1)]

Base sezione B = 100 cm

Altezza sezione H = 16.00 cm

## Verifiche combinazioni SLE

Simbologia adottata ed unità di misura

N° Indice sezione

X Ascissa/Ordinata sezione, espresso in m

M Momento flettente, espresso in kNm

V Taglio, espresso in kN

N Sforzo normale, espresso in kN

A<sub>f</sub> Area armatura inferiore, espressa in cmq

A<sub>s</sub> Area armatura superiore, espressa in cmq

σ<sub>f</sub> Tensione nell'armatura disposta in corrispondenza del lembo inferiore, espressa in MPa

σ<sub>s</sub> Tensione nell'armatura disposta in corrispondenza del lembo superiore, espressa in MPa

σ<sub>c</sub> Tensione nel calcestruzzo, espressa in MPa

τ<sub>c</sub> Tensione tangenziale nel calcestruzzo, espressa in MPa

A<sub>sw</sub> Area armature trasversali nella sezione, espressa in cmq

### Verifica sezioni fondazione [Combinazione n° 19 - SLE (Quasi Permanente)]

## Verifiche fessurazione

Simbologia adottata ed unità di misura

N° Indice sezione

$X_i$  Ascissa/Ordinata sezione, espresso in m

$M_p$  Momento, espresse in kNm

$M_n$  Momento, espresse in kNm

$w_k$  Ampiezza fessure, espresse in mm

$w_{lim}$  Apertura limite fessure, espresse in mm

$s$  Distanza media tra le fessure, espresse in mm

$\epsilon_{sm}$  Deformazione nelle fessure, espresse in [%]

### Verifica fessurazione fondazione [Combinazione n° 19 - SLE (Quasi Permanente)]

## Verifiche geotecniche

### Simbologia adottata

IC Indice della combinazione

$N_c, N_q, N_\gamma$  Fattori di capacità portante

$N_c, N_q, N_\gamma$  Fattori di capacità portante corretti per effetto forma, inclinazione del carico, affondamento, etc.

$q_u$  Portanza ultima del terreno, espressa in [MPa]

$Q_v$  Portanza ultima del terreno, espressa in [kN]/m

$Q_v$  Carico verticale al piano di posa, espressa in [kN]/m

FS Fattore di sicurezza a carico limite
